

DIGITAL PHOTO CAMERA

DKC-ST5

VCL-1205BYS

SERVICE MANUAL

CAUTION

Danger of explosion if battery is incorrectly replaced.

Replace only with the same or equivalent type recommended by the manufacturer.

Dispose of used batteries according to the manufacturer's instructions.

ADVARSEL

Lithiumbatteri - Eksplosjonsfare.
Ved utskifting benyttes kun batteri som anbefalt av apparatfabrikanten.
Brukt batteri returneres apparatleverandøren.

Vorsicht!

Explosionsgefahr bei unsachgemäßem Austausch der Batterie.

Ersatz nur durch denselben oder einen vom Hersteller empfohlenen ähnlichen Typ.
Entsorgung gebrauchter Batterien nach Angaben des Herstellers.

VARNING

Explosionsfara vid felaktigt batteribyte.
Använd samma batterityp eller en likvärdig typ som rekommenderas av apparattillverkaren.
Kassera använt batteri enligt gällande föreskrifter.

ATTENTION

Il y a danger d'explosion s'il y a remplacement incorrect de la batterie.

Remplacer uniquement avec une batterie du même type ou d'un type équivalent recommandé par le constructeur.

Mettre au rebut les batteries usagées conformément aux instructions du fabricant.

VAROITUS

Paristo voi räjähtää jos se on virheellisesti asennettu.

Vaihda paristo ainoastaan laitevalmistajan suosittelemaan tyyppiin.

Hävitä käytetty paristo valmistajan ohjeiden mukaisesti.

ADVARSEL!

Lithiumbatteri-Eksplosionsfare ved fejlagtig håndtering.

Udskiftning må kun ske med batteri af samme fabrikat og type.

Levér det brugte batteri tilbage til leverandøren.

3-659-623-11(1)

SONY.

Digital Photo Camera

Operating Instructions

Before operating this unit, please read this manual thoroughly and retain it for future reference.

DKC-ST5

© 1997 by Sony Corporation

Owner's Record

The model and serial numbers are located at the rear. Record the serial number in the space provided below. Refer to these numbers whenever you call upon your Sony dealer regarding this product.

WARNING

To prevent fire or shock hazard, do not expose the unit to rain or moisture.

To avoid electrical shock, do not open the cabinet. Refer servicing to qualified personnel only.

For the customers in the USA

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

You are cautioned that any changes or modifications not expressly approved in this manual could void your authority to operate this equipment.

The shielded interface cable recommended in this manual must be used with this equipment in order to comply with the limits for a digital device pursuant to Subpart B of Part 15 of FCC Rules.

Important Notice

Thank you for choosing the Sony DKC-ST5 Digital Photo Camera (referred to below as "the product"). The DKC-ST5 control software (referred to below as "the software") is included with the product as sample software in order to enable you to utilize the full potential of the product.

The software is provided under the following conditions.

1. The software and related documentation may not be reproduced, copied, modified, or revised in any manner, in whole or in part.
2. The software can only be used with the product, and may not be used by any third party. Export or transfer of the product and the software to any foreign country is prohibited.
3. The software may not be disassembled, decompiled, or otherwise converted to source code form.
4. The software is provided only as a sample, and Sony makes no assurance whatsoever concerning the software's freedom defects.
5. Sony disclaims all responsibility for any copyright, patent, or other non-tangible property infringement disputes that may arise with third parties as a consequence of use of the software.
6. If you determine that you have no need for the software, please destroy the diskette on which it is provided and the accompanying documentation.

Except as otherwise provided by law, unauthorized use of recorded tapes, disks, or broadcast programs is a violation of copyright laws. Therefore, please be sure to obtain proper authorization before using such materials.

About This Manual

This manual gives an overview of the DKC-ST5 Digital Photo Camera, and describes connections and installation, and the method of operation, principally with a remote controller.

Using the supplied control software

By installing the DKC-ST5 Control Software supplied with the product on two 3.5-inch floppy disks, you can control the DKC-ST5 from a computer. For details of the operation of the software, read the readme.doc file installed with the control software.

For details of the installation of the control software, see Chapter 5 of this manual.

System Features

The DKC-ST5 Digital Photo Camera is a high-quality electronic photography system, using a high-resolution CCD camera with a total of 1,400,000 pixels. This system can form the core of a studio portrait photography system, or can be used for a variety of applications in which still image are kept in a filing system.

A maximum of nine images can be held in memory. Stored images can also be transferred to a computer or color printer, for processing and printing.

The following are some of the principal features of the system.

Simple camera operation

The procedure for using the camera is similar to that for a conventional camera, so there are no particular problems for users unaccustomed to video cameras or digital devices.

Lens mount

In addition to the special-purpose lens (VCL-1205BYS), you can fit any $\frac{2}{3}$ -inch 48-mm bayonet mount lens.

High-resolution CCD camera head

The camera head uses a three-chip $\frac{2}{3}$ -inch high-resolution CCD with 1,400,000 total pixels.

Storage for up to nine images

Images can be captured into memory consecutively at about 1-second intervals. After checking captured images on a monitor, you can select the images for transfer to a computer.

Flexible color gradation representation

The A/D conversion uses a 10-bit lookup table, which makes for flexible color gradation representation.

Optimized dynamic range

Gamma correction and knee point adjustment allow the dynamic range to be optimized.

Special-purpose lens for smooth manual adjustment

The special-purpose lens (VCL-1205BYS) is available separately, and provides a focusing ring and zoom ring with a light touch, allowing for smooth manual adjustment.

System Features

DKC-ST5 Standard Product Configuration

The following is the standard product configuration of the DKC-ST5.

In addition to the standard components, a lens, video monitor, and computer are required.

For details of the components required in addition to the standard product configuration, see the section "Principal Examples of Use" on the next page.

Principal Examples of Use

The following are examples of use of the DKC-ST5 Digital Photo Camera system.

Portrait system

By combining a computer and a full-color printer, you can build an instant portrait system as shown below. You can capture a number of images into memory, review them on the monitor, then print a selected image.

Note
Do not connect or disconnect the cables when any system component is powered on.

System Features

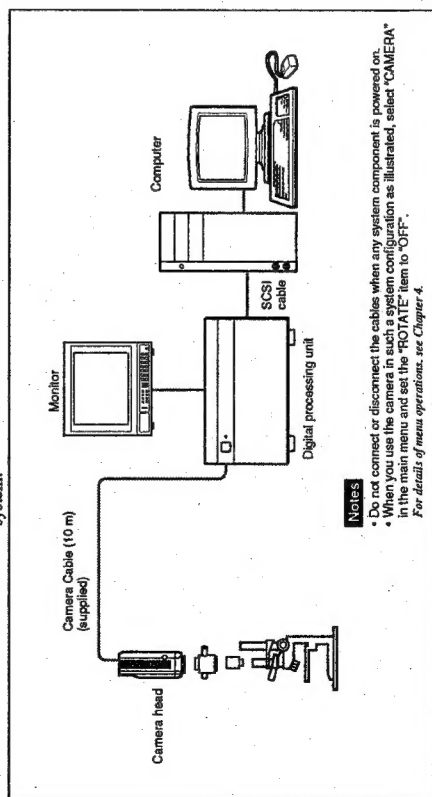

Still image filing system

In combination with a computer, you can create a still image filing system as shown below.

Medical image input system

The camera head can be used with a microscope, in a medical image input system.

Location and Function of Parts

Camera Head

Front view

① Lens mount

Mount the lens here. With the back end of the lens inserted, press down the lens locking lever in a clockwise direction to lock the lens.

In addition to the special-purpose lens (VCL-1205BYS), you can fit any $\frac{1}{2}$ -inch 48-mm bayonet mount lens.

② LENS2 connector (12-pin, female)

When using a lens other than the special-purpose one (VCL-1205BYS), connect the cable from the lens to this connector.

③ Mounting hole

This accepts the fixing screw when the camera head is mounted on a tripod.

Location and Function of Parts

Rear view

1 VF (viewfinder) connector (DIN 8-pin)
Connect the cable from the viewfinder.

2 MONITOR connector (BNC type)
This outputs a composite video signal. Using a 75-ohm coaxial cable (not supplied), connect this to the composite video input connector (BNC type) of a video monitor.

3 FLASH connector (X-contact socket)
Connect the cable from a flash unit.
This connector is not used when the cable from the flash unit is connected to the FLASH connector on the digital processor.

4 REMOTE connector (12-pin, female)
Connect the supplied remote controller.

5 LENS1 connector (20-pin, female)
When using the special-purpose lens (VCL-1205BYS), connect the cable from the lens.

6 PROCESSOR connector (26-pin, male)
Connect this to the CAMERA connector of the digital processor with the supplied camera cable.

Digital Processor

Front panel

1 POWER switch
Press this in to power on the digital processor. Press it once more to power off.

2 POWER indicator
This lights up when the digital processor is powered on.

Note

Once you have powered off the digital processor, do not try to power it on again immediately. Doing this may result in failure anyway.

Location and Function of Parts

Rear panel

1 MODE SELECT switches

These eight DIP switches select the SCSI ID of the digital processor, the attenuation compensation setting for the camera cable, and other settings.

For details of the settings of these switches, see the section "Setting the DIP Switches" on page 46.

2 SCSI In and SCSI Out connectors (50-pin, high-density)

Use these to connect to other SCSI devices (computer, printer, and so forth).

For details of the SCSI connections, see the section "SCSI Connections" on page 44.

3 FLASH connector (X-contact socket)

Connect the cable from a flash unit.
This connector is not used when the cable from the flash unit is connected to the FLASH connector on the camera head.

4 ~ AC IN connector

Use the supplied power cord to connect to a 120 V AC power outlet.

5 CAMERA connector (26-pin, female)

Connect this to the PROCESSOR connector of the camera head with the supplied camera cable.

6 REMOTE RS-232C connector (D-sub 9-pin, female)

(Undefined.)

7 REMOTE FS (foot switch) connector (mini-jack)

Connect the cable from a foot switch.

8 MONITOR connectors

These connectors output signals for input to a video monitor.

VIDEO output connector (BNC type): Using a 75-ohm coaxial cable (not supplied), connect this to the composite video input connector (BNC type) of the monitor.

S-VIDEO output connector (Mini-DIN, 4-pin): Using an S-video cable (not supplied), connect this to the S-video input connector of the monitor.

R, G, B, and SYNC output connectors (BNC type): Using 75-ohm coaxial cables (not supplied), connect these to the RGB and sync input connectors of the monitor.

Location and Function of Parts

Remote Controller

Upper section

1 STDBY (standby) button

When using a lens other than the special-purpose lens (VCL-1205BS), pressing this button puts the camera into the standby mode, and stops down the iris to the current setting.

2 LIVE/MEMORY button

Pressing this button toggles between the live and memory monitor modes.
Live mode: The image from the camera lens is output to the monitor. At this point the lens iris is automatically in the fully-open position.
Memory mode: The image saved in the currently selected memory is output to the monitor.

3 MEMORY +/- buttons

In the memory monitor mode, these buttons select the memory.

MEMORY +: Pressing this button switches from the currently selected memory to the next higher numbered memory (1 → 2 → 3 ...).

MEMORY -: Pressing this button switches from the currently selected memory to the next lower numbered memory (9 → 8 → 7 ...).

4 FOCUS FAR/NEAR buttons

These adjust the focus.
FOCUS FAR: Pressing this button focuses further away.
FOCUS NEAR: Pressing this button focuses closer to the camera.

5 Release button

Press this button to take a picture.

Using the special-purpose lens (VCL-1205BS):

Pressing this button instantaneously stops down the iris to the current setting, and captures the image to memory.

Using other lenses: If the camera is in standby mode, pressing this button instantaneously captures the image to memory. If not in standby mode, the iris is first stopped down to the current setting (which takes several seconds), and then the image is captured to memory.

6 USER button

When using the Control Software, press this button to recall user files (USER1, USER2, and USER3). Recalling one of these files automatically sets up the system according to the settings in the file. You can also use this button to switch from one user file to another.

For details of the Control Software, see Chapter 5.

7 E-ZOOM (electronic zoom) button

Pressing this button zooms in at a 2:1 ratio on the center of the live image (E-ZOOM mode). Use this button to focus quickly. Pressing the button once more exits the E-ZOOM mode, and returns to the normal image.

Note

In the E-ZOOM mode, only the FOCUS FAR/NEAR and ZOOM T/W buttons operate.

8 IRIS +/- buttons

These adjust the lens iris.

IRIS +: Pressing this button increases the numerical value of f-stop (i.e. stop down the iris).

IRIS -: Pressing this button decreases the numerical value of f-stop (i.e. open up the iris).

9 ZOOM T/W (telephoto/wide angle) buttons

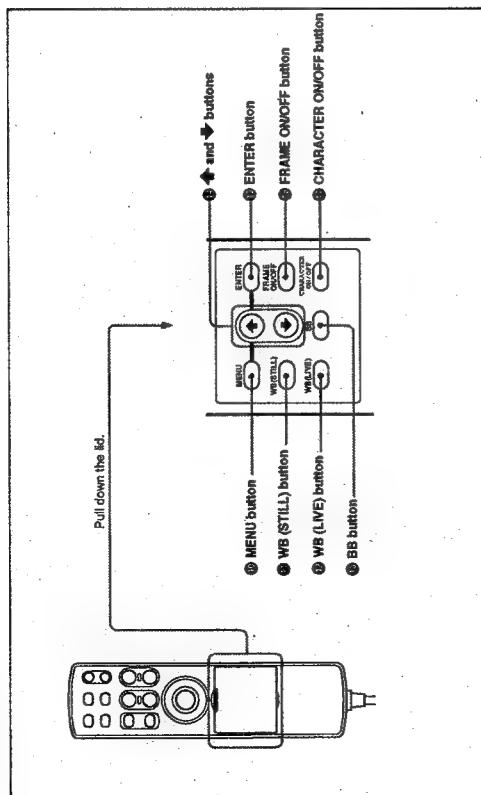

These control the zoom.

ZOOM T: Pressing this button zooms in.

ZOOM W: Pressing this button zooms out.

Location and Function of Parts

Lower section

① MENU button

Press this button to access the menus. Press and release quickly to display the main menu on the monitor screen. Press once more to clear the menu from the monitor screen. Hold down the button for at least two seconds to display the live menu.

For details of the menus, see Chapter 4.

② WB (white balance) (STILL) button

Hold this button down for at least two seconds to adjust the white balance for the still image captured to memory. This carries out the white balance adjustment automatically, with the lens iris stopped down to the current setting.

For details of the procedure for white balance adjustment, see page 21.

③ WB (white balance) (LIVE) button

Hold this button down for at least two seconds to adjust the white balance for the live image output. This carries out the white balance adjustment automatically, with the lens iris in the fully open position.

For details of the procedure for white balance adjustment, see page 27.

④ BB (black balance) button

Hold this button down for at least two seconds to adjust the black balance.

For details of the procedure for black balance adjustment, see page 26.

⑤ and ⑥ buttons

Press these buttons to move the cursor on the menu screen up and down. Also use them to adjust setting values of certain menu items.

For details of the menus, see Chapter 4.

⑦ ENTER button

Press this button to go down to the next level of the menus, and also to confirm settings made within the menus.

For details of the menus, see Chapter 4.

⑧ FRAME ON/OFF button

When using the supplied control software, press this button to toggle on and off the display on the monitor screen of a frame showing the effective print area, horizontal and vertical coordinate axes, and a background image.

The factory default setting is for this display function to be disabled.

For details of the control software, see Chapter 5.

⑨ CHARACTER ON/OFF button

Press this button to toggle the status display on the monitor screen between the on and off settings. The factory default setting is for the status display to be enabled.

The status display indicates the live or memory monitor mode, the iris setting, and the memory selection and availability.

Powering On and Off

Powering On

Use the following procedure to power on.

Note

When using the system for the first time, before powering on be sure to set the DIP switches appropriately.

For details of the settings of the DIP switches, see page 46.

- 1 Power on the monitor, printer, and other peripheral devices.

For details, refer to the user documentation provided with the peripheral devices.

- 2 Power on the digital processor (press in the POWER switch on the front panel).

If the "BEEP" item in the OTHERS menu is set to "ON" (the factory default setting), then the digital processor emits a double beep about five seconds after it is powered on, indicating that it is ready for operation.

For details of the menus, see Chapter 4.

When the digital processor is ready for operation, the system automatically switches to the live monitor mode, and the mode indication "LIVE" is displayed on the monitor screen.

For details of the live monitor mode, see the section "Live and Memory Monitor Modes" on the next page.

For details of the operating mode indication, see the section "Status Indications" on page 23.

- 3 If you are using a computer, power on the computer.

For details, refer to the user documentation provided with the computer.

Note

If you power on the computer before the digital processor is ready for operation (after the double beep), the computer may not start up correctly.

Powering On and Off

Powering Off

Use the following procedure to power off.

- 1 If you are using a computer, power off the computer.
For details, refer to the user documentation provided with the computer.
- 2 Power off the digital processor (press the POWER switch on the front panel).
- 3 Power off the monitor, printer, and other peripheral devices.

Live and Memory Monitor Modes

Pressing the LIVE/MEMORY button on the remote controller toggles between the live and memory monitor modes.

- In the live monitor mode, the image from the camera is output to the monitor. At this point the lens iris is automatically in the fully-open position, regardless of the current setting, and "LIVE" appears in the status indication on the monitor in the position indicating the mode.
- In the memory monitor mode, the image saved in the memory currently selected with the MEMORY +/- buttons is output to the monitor. "MEMORY" appears in the status indication on the monitor in the position indicating the mode, together with the selection and availability of the memories (1 to 9).

For details of the memory status indication, see the next section.

Status Indications

Pressing the CHARACTER ON/OFF button on the remote controller toggles the status display on the monitor screen between the on and off settings.

- When the status display is in the "on" mode, it indicates the live or memory monitor mode, the iris setting, and the memory status (selection and availability of each memory).
- Even when the status display is in the "off" mode, the status display appears, but disappears again after a few seconds.

The following illustration shows the positions of the various status indication items.

Image Adjustments and Focusing

Adjusting the Zoom

To zoom in
Press the ZOOM T (telephoto) button on the remote controller.

To zoom out
Press the ZOOM W (wide angle) button on the remote controller.

To adjust the zoom angle manually
Set the lens to manual zoom mode, and turn the zoom ring.

Focusing

Focusing without changing the zoom angle

- To focus further away, press the FOCUS FAR button on the remote controller.
- To focus closer, press the FOCUS NEAR button on the remote controller.
- To focus manually, set the lens to manual focusing mode, and turn the focusing ring.

For most accurate focusing
Using the E-ZOOM function, you can focus more accurately.

1 Press the ZOOM T button on the remote controller, to select the narrowest telephoto angle.

2 Press the E-ZOOM button.

This switches to the E-ZOOM mode, and zooms in at a 2:1 ratio on the center of the image.

3 Press the FOCUS FAR button or FOCUS NEAR button to adjust the focus.

4 Press the E-ZOOM button.

This exits the E-ZOOM mode, and returns to the normal image.

Note

Until you exit from the E-ZOOM mode, only the FOCUS FAR/NEAR and ZOOM TW buttons operate.

Adjusting the Black Balance

To obtain images with a natural color balance, carry out black balance adjustment in the following cases. The adjustment setting is preserved for about ten years, even when the unit is powered off.

- When using the camera for the first time
- When you have replaced the camera
- When the camera has not been used for a long interval
- When the ambient temperature has changed greatly
- At the change of the seasons

Use the following procedure to carry out black balance adjustment.

- 1 Check that the lens is in automatic iris mode.

Note

If you are using a lens with no automatic iris function, close the iris completely.

- 2 Hold down the BB button on the remote controller for at least two seconds.

This automatically closes the lens iris completely, and carries out black balance adjustment. The message "Reading Color Table..." appears on the monitor screen.

The image on the monitor screen may flicker while the adjustment is in progress, but this is not a fault.

When the adjustment is completed, the message "BB:OK" appears.

If the adjustment was not achieved

The message "BB:NG Please try again" appears. Repeat the above procedure.

Adjusting the White Balance

To obtain images with a natural color balance, carry out white balance adjustment in the following cases. The adjustment setting is preserved for about ten years, even when the unit is powered off.

- When using the camera for the first time
- When the lighting conditions change

This system keeps separate white balance settings for the still images captured to memory and the live image output to the monitor.

Adjusting the white balance for still images

After setting up the lighting, use the following procedure.

- 1 Press the MENU button on the remote controller to access the main menu, and make the following settings.
 - Select the PICTURE menu, and set "C-TEMP" to "AWB" (this is the factory default setting).
 - Select the FLASH menu, and if using a flash, set the "FLASH" item to "ON" (this is the factory default setting). Next select the flash interval with the "INTERVAL" item.
 - If not using a flash, set the "FLASH" item to "OFF."

For details of menu operations, see Chapter 4.

- 2 Press the IRIS +/- buttons to adjust the iris.

For details of the adjustment, see page 30.

(Continued)

Adjusting the White Balance

- 3 Under the same lighting conditions as for shooting, position a white subject (white pattern, white cloth, etc.), and zoom in so that it fills the screen.
- 4 Hold down the WB (STILL) button on the remote controller for at least two seconds.
This automatically starts white balance adjustment. The message "Reading Color Table..." appears on the monitor screen. If the FLASH menu setting is "FLASH ON", the flash flashes several times.
When the adjustment is completed, the message "WB:OK" appears.
If the adjustment was not achieved
The message "WB:NG Please try again" appears. Repeat the above procedure.

Adjusting the white balance for live images

After setting up the lighting, in live monitor mode use the following procedure.

- 1 Hold down the MENU button on the remote controller for at least two seconds to access the live menu, and set "C-TEMP" to "AWB".

For details of menu operations, see Chapter 4.

- 2 Under the same lighting conditions as for shooting, position a white subject (white pattern, white cloth, etc.), and zoom in so that it fills the screen.
- 3 Hold down the WB (LIVE) button on the remote controller for at least two seconds.

This automatically starts white balance adjustment. The message "Reading Color Table..." appears on the monitor screen.

When the adjustment is completed, the message "WB:OK" appears.

If the adjustment was not achieved

The message "WB:NG Please try again" appears. Repeat the above procedure.

Adjusting the Iris

Use the following procedure to adjust the iris setting (f-stop) at the instant that a still image is captured to memory.

Note

For normal purposes select F5.60 (factory default setting).

- 1 Set the lens to the automatic iris mode.
- 2 If in the memory monitor mode, press the LIVE/MEMORY button to switch to the live mode.
- 3 If the status display mode is off, press the CHARACTER ON/OFF button to switch on the status display.

The "LIVE" mode indication appears on the monitor screen.

The f-stop setting appears on the monitor screen.

- 4 • To increase the numerical value of the f-stop (i.e. to stop down the iris for still image capture), press the IRIS + button.
- To decrease the numerical value of the f-stop (i.e. to open up the iris for still image capture), press the IRIS - button.

Note

Changing this setting does not affect the iris during output of live images. The f-stop setting only takes effect when the release button is next pressed.

Shooting

This section describes the procedures for selecting image memories and for shooting (capturing an image into the selected memory).

Basic Procedure

The following is the basic procedure for shooting.

- 1 If the status display mode is off, press the CHARACTER ON/OFF button to switch on the status display, and check the memory status indication (selection and availability).

- 2 Select the memory into which you wish to capture an image.

For details, see the section "Selecting a Memory" on page 33.

Note

If you select a memory which already holds an image, carrying out step 4 will overwrite this existing image in the memory.

- 3 If in the memory monitor mode, press the LIVE/MEMORY button to switch to the live monitor mode.

The "LIVE" mode indication appears on the monitor screen.

(Continued)

Shooting

4 Press the release button.

This instantaneously stops the lens down to the iris setting, and captures an image to the selected memory.

Note

When using a lens other than the special-purpose lens (VCL-1205BS), press the STDBY button first, to switch to the standby mode, then press the release button. When you switch to standby mode, after about 3 seconds the iris is stopped down to the current setting, and the "STAND-BY" mode indication appears on the monitor screen.

• When the memory selection mode is "increment on," first the system switches to review mode, and the image captured to memory appears on the monitor for a few seconds.

Next the system switches back to live monitor mode. During the review, the "REVIEW" mode indication appears on the monitor screen.

• When the memory selection mode is "increment off," the system switches to memory monitor mode, and the image captured to memory is displayed on the monitor screen.

For details of the memory selection mode, see the section "Selecting a Memory" on the next page.

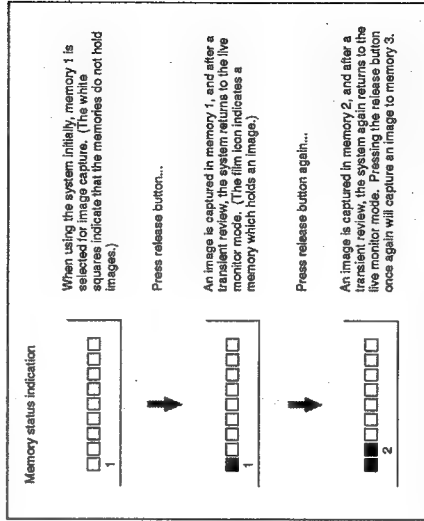

5 To continue shooting, repeat steps 2 to 4.

Selecting a Memory

There are two modes in which you can select a memory: "increment on" mode, and "increment off" mode.

"Increment on" mode

In "increment on" mode, each time you press the release button to capture an image in memory, the memory selection for the next image is incremented automatically (1, 2, 3, ... 9). The following shows how the memory selection changes in "increment on" mode.

To select the "increment on" mode

From the main menu, select the CAMERA menu, then set the "INCREMENT" item to "ON" (this is the factory default setting).

For details of menu operations, see Chapter 4.

"Loop on" mode and "loop off" mode

In "increment on" mode, there are two ways of operating: either the "loop on" mode or the "loop off" mode.

"Loop on" mode: After an image is captured to memory 9, memory 1 is automatically selected for the next image.

Note

If there is already an image stored in memory 1 (i.e. the status indication shows a film icon for memory 1), when you press the release button this captures a new image to memory 1, and the previously stored image is lost.

"Loop off" mode: After an image is captured to memory 9, there is no automatic memory selection, and after the review, the system returns to the live monitor mode with a message "MEMORY FULL" display.

To switch between "loop on" mode and "loop off" mode

From the main menu, select the CAMERA menu, then set the "LOOP" item to "ON" (this is the factory default setting) or "OFF."

"Increment off" mode

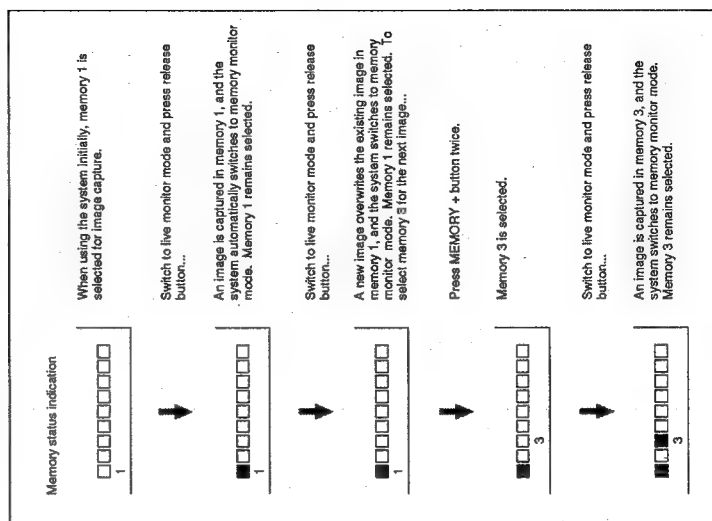

In "increment off" mode, when you press the release button there is no automatic memory selection. To select the memory, enter memory monitor mode, then press the MEMORY +/- buttons.

To select memory numbers in ascending order press the MEMORY + button, and to select memory numbers in descending order press the MEMORY - button.

Note

The MEMORY +/- buttons do not operate in the live monitor mode. First press the LIVE/MEMORY button to switch to memory monitor mode.

The following shows an example of operation in "increment off" mode.

Shooting

To select the "Increment off" mode

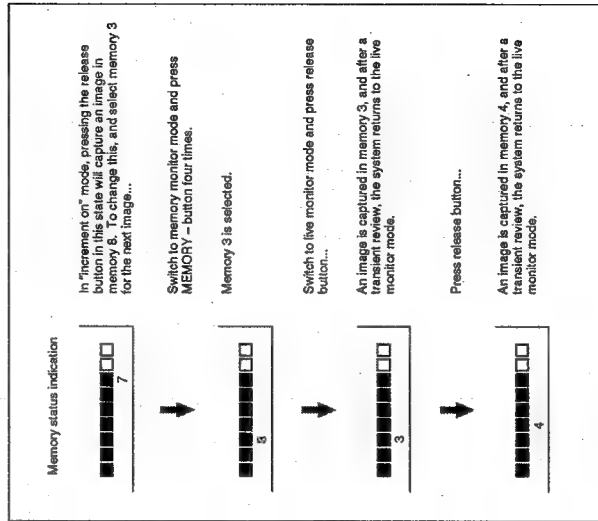

From the main menu, select the CAMERA menu, then set the "INCREMENT" item to "OFF."

For details of menu operations, see Chapter 4.

Manually selecting a memory while in "Increment on" mode

Even in "Increment on" mode, you can use the MEMORY +/- buttons to select a memory.

The following shows an example of such operation.

Preventing overwriting of memory

By control from the computer, you can lock any particular memory so that it cannot be overwritten.

When a memory is locked in this way (status indication ) the memory selection basically proceeds in the same way as before, except that any locked memories are skipped. In other words, if only memory 4 is locked, an image which would have been captured in memory 4 is in fact captured in memory 5.

Shooting

Reviewing a Captured Image

In "Increment on" mode

When the memory selection mode is set to "increment on," pressing the release button causes the system to automatically switch to review mode, and display the captured image on the monitor screen for several seconds. Thereafter it automatically returns to the live monitor mode. Thus you can continue to capture images while quickly checking each one.

In "Increment off" mode

In this mode, pressing the release button causes the system to switch to the memory monitor mode, and display the captured image on the monitor screen. The same image remains displayed until you select the live monitor mode again.

Selecting memory monitor mode to check images

Whether in the "increment on" or "increment off" mode, you can check the contents of any particular memory by using the following procedure.

- 1** If not in memory monitor mode, press the LIVE/MEMORY button to switch to the memory monitor mode.

This displays the image held in the currently selected memory on the monitor.

- 2** Press the MEMORY +/- buttons to select other memories to check.

This displays the image held in each selected memory on the monitor.

Switching Between Landscape and Portrait Orientations

You can turn the tripod mount through 90 degrees to alter the camera orientation, for either portrait or landscape images.

Menu and status indications

When the camera head is in the landscape orientation, the display of menus and status information on the monitor screen is also turned through 90 degrees.

To make these displays horizontal as in the portrait mode, from the main menu select the CAMERA menu, and set the "ROTATE" item to "OFF."

For details of menu operations, see Chapter 4.

Notes

- It is recommended to use a portrait monitor when shooting in portrait format and a landscape monitor when shooting in landscape format. Physically rotating a monitor through 90 degrees may damage it or cause it to fail.
- When using the camera head in the orientation shown below, select the CAMERA menu from the main menu and set the "ROTATE" item to "OFF."

Installing the Camera Head

Mounting the Camera Head on a Tripod

Align the threaded mounting hole on the bottom of the camera with the fixing screw on the tripod mount, and tighten the fixing screw securely.

Note

The tripod must be designed to support a load of at least 5 kg.

Mounting the Lens

Insert the lens into the camera lens mount, then press down the lens locking lever in a clockwise direction. Make sure that the lens is inserted with the projection on the mounting end in alignment with the engaging hole marked in red.

Connections

The connections required depend on the system components being used.
See the section "Principal Examples of Use" on page 9 to determine the required devices.

Attaching Ferrite Cores to Cables

To protect the digital processor against noise which may affect its operation, attach supplied ferrite cores (noise filters) to some of the connection cables as shown below.

SCSI Connections

This section describes the SCSI connections between the DKC-ST5 and a computer and any other SCSI devices.

Power off the DKC-ST5 and all of the other connected devices before making the SCSI connections.

SCSI Cables

It is recommended to use high-impedance cables complying with the SCSI standard for the connections.

Note

Up to seven SCSI devices can be connected in a daisy-chain to the SCSI port of the computer, but the total length of the SCSI cables should not exceed 6 meters.

SCSI Terminators

Using the DKC-ST5 internal terminator

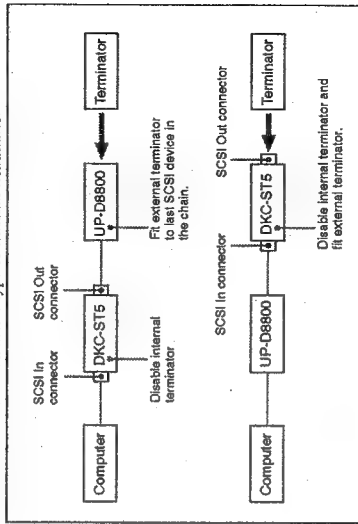

The DKC-ST5 has a built-in active SCSI terminator. If you do not have an external terminator, then as shown in the following illustration, connect the DKC-ST5 as the last device in the chain, and enable the internal terminator. (Set DIP switch 4 on the digital processor to the ON position; see page 46.)

Not using the DKC-ST5 internal terminator

In this case, carry out the two following items:

- Disable the DKC-ST5 internal terminator. (Set DIP switch 4 on the digital processor to the OFF position; see the next page.)
- Fit an external terminator to the last SCSI device in the chain. It is recommended to use an active type of external terminator.

Note

The maximum number of terminators which can be used in a SCSI chain is three.

SCSI ID

When you connect a number of SCSI devices in a daisy-chain, it is important to assign SCSI IDs (0 to 7) to the devices in such a way that they do not conflict.

To set the SCSI ID of the DKC-ST5, use DIP switches 6 to 8 on the digital processor.

For details of the settings of the DIP switches, see the next page.

Note that the allocation of IDs is not related to the physical sequence of the devices in the chain.

Setting the DIP Switches

There are eight DIP switches on the rear panel of the digital processor. When using the system for the first time, before powering on set these switches appropriately. The following shows the function of each of the DIP switches.

Overview

You use the menus to make various camera settings such as the color temperature conversion characteristics, the electronic shutter speed, and so forth. There are two principal menus, the main menu, and the live menu.

Main menu

All settings affecting still images (i.e. those captured into memory) are in the main menu, which consists of a number of submenus.

For details of the settings in the main menu, see page 51.

To access the main menu
Press the MENU button.

Live menu

The live menu contains only color balance settings for live images (i.e. the camera output in live monitor mode).

For details of the settings in the live menu, see page 54.

To access the live menu
Hold down the MENU button for at least two seconds.

Basic Menu Operation Procedure

This section illustrates the basic menu operation procedure, taking as an example the method of setting the ISO exposure index (the "film speed"). Note that the procedure for accessing the live menu is exactly the same, except that you must hold down the MENU button for at least three seconds.

Use the following procedure to set the ISO exposure index.

- 1 Press the MENU button.

The main menu appears on the monitor screen. When you access the main menu initially, the cursor is by the PICTURE item.

- 2 Press the \blacktriangledown button to align the cursor with "CAMERA."

This selects the CAMERA menu, and the following items appear.

- 3 Press the ENTER button.

The cursor enters the CAMERA menu, and the extra "RETURN" item appears in the bottom line.

- 4 Press the \blacktriangledown button to align the cursor with "EXPOSURE."

- 5 Press the ENTER button.

This displays the setting list for the "EXPOSURE" item, with the cursor pointing to the current setting.

(Continued)

- 6 Press the and buttons to move the cursor to the desired new setting.

- 7 Press the ENTER button.

This updates the setting for "EXPOSURE."

- 8 To exit from the menus, press the MENU button.

The main menu disappears from the monitor screen.

Menu Settings

Main Menu

The main menu consists of the following submenus:

- PICTURE menu
- CAMERA menu
- FLASH menu
- OTHERS menu

The following tables list the settings in each submenu.

PICTURE menu

Menu Item	Settings
C-TEMP Set the color temperature conversion characteristics of the camera to match the light source being used. Factory default setting: AWB	AWB: Automatically select the color balance setting taken for still images. 5600K: Use this setting for daylight or fluorescent lighting. 3200K: Use this setting for tungsten lighting. Factory default setting: AWB
•RED Adjust the red gain. (After a white balance adjustment, it is not normally necessary to set this item.)	-127 to +127 Factory default setting: 0
•BLUE Adjust the blue gain. (After a white balance adjustment, it is not normally necessary to set this item.)	-127 to +127 Factory default setting: 0
CONTRAST Adjust the contrast.	-5 to +5 Factory default setting: 0
SHARPNESS Adjust the degree of outline emphasis (low, middle, or high)	OFF: No outline emphasis LOW, MIDDLE, HIGH Factory default setting: LOW
MASKING Adjust the degree of increasing the color saturation (low, medium, and high).	OFF: No increase in the color saturation. LOW, MIDDLE, HIGH Factory default setting: LOW
GAMMA Adjust the gamma correction setting.	STANDARD: Use the standard setting. PRESET1, PRESET2, PRESET3: Use the respective PRESET1, PRESET2, and PRESET3 settings. Factory default setting: STANDARD

Menu Settings

CAMERA menu

Menu Item	Settings
SHUTTER Set the camera shutter speed (in seconds)	4, 2, 1, 1/2, 1/25, 1/50, 1/60, 1/125, 1/250, 1/500, 1/1000, 1/2000, 1/5000, 1/10000 Factory default setting: 1/125
EXPOSURE Set the ISO exposure index for the camera	ISO 20, 40, 80, 160 Factory default setting: ISO 20
INCREMENT Select whether the memory selection is incremented automatically or not. For details of the method of memory selection, see page 33.	ON: The memory selection is incremented automatically. When this setting is selected, the menu items "REVIEW TIME", "IRIS OPEN", and "LOOP" appear. OFF: The memory selection is not incremented automatically. Factory default setting: ON
REVIEW TIME When the above "INCREMENT" item is set to "ON," select whether the review time, during which an image captured to memory is displayed after the release button is pressed, is adjusted.	0 sec, 1 sec, 3 sec, 5 sec, 10 sec Factory default setting: 3 sec
IRIS OPEN When the above "INCREMENT" item is set to "ON," select whether after the release button is pressed to return to the live monitor mode, or not (i.e., to return the lens iris to the fully open position).	ON: Return to the live monitor mode. Use this setting when you wish to check each new image on the monitor screen. OFF: Do not return to the live monitor mode (keep the iris setting unchanged). Use this setting when the timing of image capture is important. Factory default setting: ON
LOOP When the above "INCREMENT" item is set to "ON," select whether or not to use the memory loop mode. For details, see page 34.	ON: Select the memory loop mode. After capturing an image to memory 9, memory 1 is automatically selected for the next image. OFF: Do not select the memory loop mode. After capturing an image to memory 9, the message "MEMORY FULL" appears. Factory default setting: ON
ROTATE Select whether or not to rotate the menu and status displays on the monitor screen through 90 degrees.	ON: Rotate the displays through 90 degrees. Use this setting to make it easier to check the displays in portrait format. OFF: Do not rotate the displays through 90 degrees. Use this setting to make it easier to check the displays in landscape format. Factory default setting: ON
AE MODE Select the manual or automatic exposure mode.	MANUAL: Manual adjustment APERTURE: Aperture priority automatic exposure SHUTTER: Shutter priority automatic exposure PROGRAM: Program automatic exposure Factory default setting: MANUAL
METERING Select the exposure metering method in the live monitor mode.	PEAK: Adjust exposure to the maximum intensity "cell of image" as defined by dividing the whole image into nine cells having the same area. (The illustration below shows a case in which the maximum intensity cell is the central cell.) With this setting the surroundings of highlights may become dark.  AVG: Adjust exposure to the average intensity of the image. With this setting there may be "burn-out" in the highlights. Factory default setting: PEAK

FLASH menu

Menu Item	Settings
FLASH Select whether or not to use the flash.	ON: Use the flash. When this setting is selected, the menu items "INTERVAL", "CUTOFF SW", and "CALIBRATION" appear. OFF: Do not use the flash. Factory default setting: ON
INTERVAL When the above "FLASH" item is set to "ON," select the flash operation interval.	1 sec, 3 sec, 5 sec, 10 sec Factory default setting: 3 sec Note If the setting is less than the charge time for the flash used, correct automatic control will not be possible.
CUTOFF SW When the above "FLASH" item is set to "ON," select whether or not to carry out mechanical control of the X-contacts on the FLASH connector of the digital processor.	ON: Carry out mechanical control. OFF: Do not carry out mechanical control. Factory default setting: OFF Note Even when set to "ON," there is no mechanical control of the X-contacts on the camera.
CALIBRATION When the above "FLASH" item is set to "ON," measure the synchronized timing of the flash and the electronic shutter.	START: Carry out the measurement. CANCEL: Do not carry out the measurement.

OTHERS menu

Menu Item	Settings
BEEP Select whether or not to beep for confirming an operation.	ON: Beep. OFF: Do not beep. Factory default setting: ON
RESET Reset all of the user menu settings to their factory defaults.	START: Carry out the reset. CANCEL: Do not carry out the reset.

Menu Settings

Live Menu

The live menu consists of the following settings.

Menu Item	Settings
C-TEMP Set the color temperature conversion characteristics of the camera to match the light source being used.	Settings: Automatically select the color balance setting taken for live images. 5000K: Use this setting for daylight or fluorescent lighting. 3200K: Use this setting for tungsten lighting. Factory default setting: AWB
*RED Adjust the red gain. (After a white balance adjustment, it is not normally necessary to set this item.)	-127 to +127 Factory default setting: 0
*BLUE Adjust the blue gain. (After a white balance adjustment, it is not normally necessary to set this item.)	-127 to +127 Factory default setting: 0

Overview

The two floppy disks supplied with the DKC-ST5 contain control software which runs under Microsoft Windows 95[®] and is designed for the following purposes:

- Capturing image data from the DKC-ST5 into the computer
- Carrying out settings and basic operations on the DKC-ST5 from the computer

Chapter 5 describes the environment required for running the control software and the procedure for installation, and also some notes on SCSI connections.

Background Information

The following explanation assumes the reader is familiar with basic computer terminology, and has read the introductory documentation relating to Microsoft Windows 95 (Microsoft Windows User's Guide and so forth).

Required Hardware

Computer

An IBM PC/AT[®] or compatible computer with the following specification is required:

- CPU: Intel Pentium or PentiumPro[®]
- RAM capacity: at least 32 MB
- Monitor: 24-bit full-color display function
- Free disk space: at least 150 MB

SCSI Host Adapter with Windows 95 Support

One of the following Adaptec host adapters is required:

- SCSI Direction AHA-1522 (for ISA bus)
- The SCSI Master AHA-1540CP (for ISA bus)
- PCI SCSI Master AHA-2940 (for PCI bus)
- SlimSCSI APA-1460 (for PCMCIA slot)

Notes

- The control software may not run correctly using the Microsoft Windows 95 built-in SCSI host adapter device driver and ASP32 manager.
- Be sure to install the device driver and ASP32 manager stored on the miniport driver disk for Microsoft Windows 95 shipped with the host adapter. After installation, in the System folder within the directory for Windows, the following file should be present:
ASP32 manager (wnaspi32.dll)

Also in the \osubsys\ folder beneath this should be the following:
Device driver for the SCSI host adapter
(sparrow.mpd\ahal54x.mpd\aic78xx.mpd)

Check that these files are dated no earlier than November 1, 1995.

- If your host adapter was not shipped with a miniport driver disk for Microsoft Windows 95, install a new driver from Adaptec's EZ-SCSI[®] Pro Version 4.5 for Microsoft Windows 95.

Required Software

The Microsoft Windows 95 operating system is required.

- 1) Microsoft and Windows are registered trademarks of Microsoft Corporation.
- 2) IBM and AT are registered trademarks of International Business Machines Corporation.

- 3) Pentium and PentiumPro are registered trademarks of Intel Corporation.
- 4) ASPi and EZ-SCSI are registered trademarks of Adaptec Inc.

Installing the Control Software

Preparations

Checking the SCSI Host Adapter

Use the following procedure to check that the Adaptec SCSI host adapter is correctly installed.

- 1 Start Microsoft Windows 95.
- 2 Open the Control Panel window, and double-click the System icon.
- 3 Click on the Device Manager tab, and check that the host adapter to be used for the SCSI controller is displayed.

Connecting the DKC-ST5 and computer

Power off the computer, the DKC-ST5, and any other devices in the system, then connect the DKC-ST5 and the computer with the SCSI cable.

For details of the SCSI connection, see pages 42 to 45.

Setting the DKC-ST5 SCSI ID

With all of the devices powered off, set DIP switches 6 to 8 on the rear panel of the digital processor to a SCSI ID which does not conflict with other devices.

For details, see pages 45 and 46.

Note

The DKC-ST5 does not support SCAM (SCSI Configured Automatically). Even when using a host adapter which supports SCAM, you must manually set an ID which does not conflict.

For details, refer to the documentation provided with your SCSI host adapter.

Powering on the system

Following the description on page 21, power on the system.

Installing the Control Software

Use the following procedure to install the control software in the computer.

- 1 Start Microsoft Windows 95.

When starting Microsoft Windows 95 for the first time after connecting the DKC-ST5 and the computer

In this case a dialog box appears, prompting you to install a device driver.

Since the control software is supported by the ASP132 manager, no driver installation is required. In the dialog box, select "Do not install a driver" and click the OK button.

When starting Microsoft Windows 95 for the second and subsequent times, this operation is not required. The dialog box will, however, appear again if you change the SCSI ID of the DKC-ST5.

- 2 Insert floppy disk 1 supplied with the DKC-ST5 into the floppy disk driver.
- 3 Access the floppy disk, and display a file list.
- 4 Double-click SETUP.EXE.

The setup program starts. Thereafter, follow the directions given in dialog boxes.

Using the Control Software

Installing the control software simultaneously installs a readme.doc file. For details of how to use the control software, consult the readme.doc file.

Note

The control software will hang if after starting it you do any of the following on the DKC-ST5:

- Power off the digital processor
 - Disconnect the camera cable from the digital processor or camera head
 - Disconnect the SCSI interface between the DKC-ST5 and the computer
- If the control software hangs, it will be necessary to restart the system.

Uninstalling the Control Software

Use the following procedure to uninstall the control software.

Note

Before beginning this operation, check the following.

- The control software is not running.
- The readme.doc file about the control software is not open.

- 1 Open the Microsoft Windows 95 Control Panel window, and double-click "Add/Remove Programs," then click on "Install/Uninstall."
 - 2 Select "DKC-ST5" from the list of programs, and click the Add/Remove button.
- Thereafter, follow the directions given in dialog boxes.

Error Messages

If the system is unable to operate normally because of a particular combination of operations, an error message may appear on the monitor. The following table lists the error messages, with their meanings and appropriate action to take.

Message	Meaning	Action to take
BB:NG Please try again	Black balance adjustment failed.	Check the conditions, and try again.
COMMANDER IS LOCKED	The remote controller has been locked by the computer.	Unlock the remote controller from the computer.
FLASH CALIBRATION: NG	Flash calibration failed.	Check the conditions, and try again.
MEMORY FULL	The memory for captured images is full.	Delete images no longer required from memory.
MEMORY IS LOCKED	The currently selected memory for captured images is locked (write-protected).	Either unlock this memory, or select a different memory.
Not available during transferring image data	This operation is not possible during image data transfer.	Wait until image data transfer is finished.
Not available except AWB setting as C-Temp	This operation is not possible unless the "C-TEMP" menu item is set to "AWB."	Set the "C-TEMP" menu item to "AWB."
Not available in E-ZOOM mode	This operation is not possible in the electronic zoom mode.	Exit from the electronic zoom mode and retry.
WB:NG Please try again	White balance adjustment failed.	Check the conditions, and try again.

Troubleshooting

If a problem should occur when you are using the system, consult the following troubleshooting chart, and carry out any suggested action. If you are unable to resolve the problem, or if the problem occurs persistently, contact your Sony dealer.

Symptom	Cause / Items to check / action to take
The system does not power on.	Is the power cord connected correctly? (See page 42.)
The buttons of the remote controller do not operate.	Is the remote controller cable connected correctly? (See page 42.)
There is no image on the monitor.	Are the video signal cables (R, G, B) connected correctly? (See page 42.)
The monitor image colors are peculiar.	There may be blurring when photographing a fast-moving subject. This is not a fault.
Captured images are blurred.	Is the attenuation compensation setting for the camera cable set correctly? Set DIP switch 1 according to the length of the cable. (See page 46.)
The picture quality from the camera is poor.	If the image being displayed is from memory, there will be no change. In this case, switch from memory monitor mode to live monitor mode.
Changing the camera settings does not affect the image on the monitor.	When shooting a moving subject, this may occur in the image on the monitor. This is not a fault, and does not affect captured images.
There are a number of horizontal lines on a live image.	Set the FOCUS/ZOOM switch to the POWER position.
When I change the focus and zoom settings, the lens does not respond.	In this system, when an image is displayed on the monitor the color look-up table is optimized to give the best gradation. The image may not therefore necessarily appear identically on a computer screen.
When an image is transferred to a computer and displayed, the color gradation is completely different from that in the monitor image.	Have the gamma settings been changed since the image was captured? For the same reason as in the previous item, if the current gamma settings are different from the gamma settings when the image was captured, it will not be displayed correctly on the monitor.
When a captured image is displayed on the monitor, the color gradation is peculiar.	This is not a fault.
When shooting with the flash on, the image flickers at the instant an image is captured to memory.	This is caused by the electronic shutter reacting to the high frequency variations in intensity which are a characteristic of fluorescent lighting, and is not a fault.
The color temperature of the live image sometimes changes under fluorescent lighting.	When using flash the images shot are not affected, if not using flash, as far as possible shoot under tungsten lighting.
However I change the settings, the dynamic range of an image transferred to the computer does not fill the 0 to 255 range.	Is the "CONTRAST" setting in the PICTURE menu set to a negative value? (See page 57.)
I have used cropping on images captured to memory to transfer them part by part to the computer. However, it does not seem to be possible to join them back together again correctly.	Because of the details of the image processing algorithm, it is not in general possible to join parts of images back together without subtle problems of pixel mismatch.
The computer does not recognize the digital processor.	<ul style="list-style-type: none"> Is the SCSI cable connected correctly? (See pages 42 to 45.) Is there a SCSI ID conflict? (See pages 45 and 46.) Is the SCSI terminator fitted correctly? (See page 44.)
SCSI operations are unstable.	

Notes on Use

Do not obstruct ventilation openings

To prevent the camera and processor from overheating, do not obstruct ventilation openings, by for example wrapping the camera and processor in a cloth while they are in operation.

Operation and storage locations

Avoid operation or storage in any of the following places.

- Location subject to extremes of temperature (operating temperature range 5°C to 35°C (41°F to 95°F))
- Location subject to direct sunlight for long periods, or close to heating appliances (Note that the interior of a car left in summer with the windows closed can exceed 50°C (122°F).)
- Damp or dusty places
- Location subject to severe vibrations
- Location near equipment generating strong electromagnetic emissions
- Location near transmitting stations generating strong radio waves

Operate the processor in a horizontal position

The processor is designed to be operated in a horizontal position. Do not operate it on its side, or tilted through an excessive angle (exceeding 20°).

Avoid violent impacts

Dropping the camera and processor, or otherwise imparting a violent shock to them, is likely to cause them to malfunction.

Care

If the casing or panel is dirty, wipe it gently with a soft dry cloth. In the event of extreme dirt, use a cloth steeped in a neutral detergent to remove the dirt, then wipe with a dry cloth. Applying alcohol, thinners, insecticides, or other volatile solvents may result in deforming the casing or damaging the finish.

Shipping

Pack the camera and processor their original carton or equivalent packing, and take care not to impart violent shocks in transit.

Specifications

Camera head

Imaging element $\frac{1}{2}$ -inch CCD, with approximately 1,400,000 pixels

Effective image area

1,280 (H) \times 1,024 (V) pixels
Vertical and horizontal

Pixel offset

Photography system

3 elements

Lens mount $\frac{1}{2}$ -inch 48 bayonet mount

EXPER

SECTION 2 SERVICE INFORMATION

2-1. BOARD LAYOUT

• Processor block

• Camera block

2-2. PROCESSOR BLOCK DISASSEMBLY

2-2-1. Removal of Cabinet

2-2-2. Removal of the ADA-52 and SY-243 Boards

2.

3.

2-2-3. Removal of the Rear Panel Block

1.

4.

NOTE: When assembling rear panel assembly, connect the CN11 to CN101.

2-2-5. Removal of the Switching Regulator

2-2-4. Removal of the MB-725 Board

2-2-6. Removal of the CN-1396 Board

2-3. CAMERA BLOCK DISASSEMBLY

2-3-1. Removal of the Cabinet

2-3-3. Removal of the PR-228 Board

NOTE: When assembling PR-228 board, connect the CN1 to CN202.

2-3-2. Removal of the AT-115 Board

NOTE: When assembling AT-115 board, connect the CN1 to CN204.

2-3-4. Removal of the Rear Block

2-3-5. Removal of the Bottom Base Assembly

NOTE: When disconnecting the flat harness, pull simultaneously portions A and B in the direction indicated by the arrows and pull out the flat harness.

When connecting the flat harness, firstly, insert the harness into the connector and push simultaneously portions A and B in the opposite direction indicated by the arrows.

2-3-7. Removal of the CCD Block Assembly

2-4. HOW TO USE EXTENSION BOARD

2-4-1. Processor block

- Extension board EX-577
(Sony part No. : J-6276-450-A)

2-4-2. Camera block

- Extension board EX-630
(Sony part No. : J-6276-490-A)

- Extension board EX-631
(Sony part No. : J-6276-500-A)

2-5. AFTER CCD BLOCK IS REPLACED

After replacing CCD block, if photograph would be performed and the picture would be taken in the computer, the noise may be generated. To prevent this, it is needed to memory the defect information of the CCD for the camera.

Connection

2-5-1. Equipment required

(1) Hardware

IBM-PC mutual changeable model

- It has an Intel 80486 or a Pentium processor or it is attached with more than 16M bite main memory.
- SCSI host adapter AHA-1522/2940 series——Adaptec
(Connection between DKC-ST5 and the computer with SCSI cable)

(2) Software

- MS-Window 95
- Adaptec EZ-SCSI V4.5J or more
(Install the ASPI manager.)
- CCD DATA(E) TOOL —— J-6276-700-A (SONY part number)

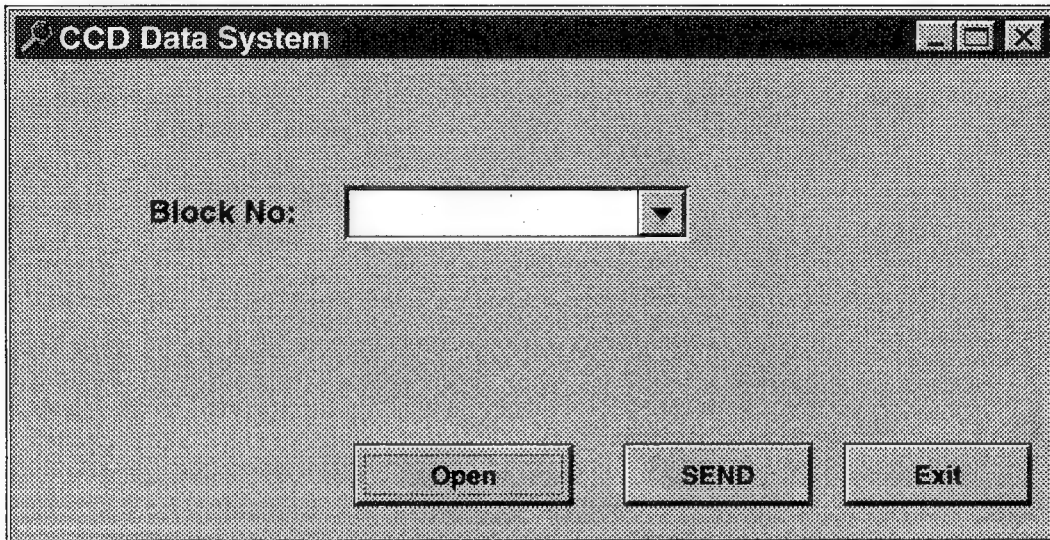

2-5-2. OPERATION DESCRIPTION

(1) Starting of application

If above icon is double-clicked, application is started.

(2) Main dialog box

After application started, main dialog box is indicated.

(3) Selection of file

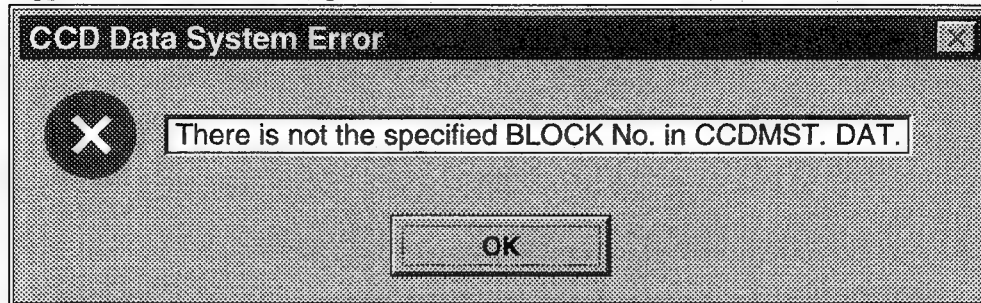

- ① Click the open—button.
- ② Dialog box of file selection is indicated.
- ③ If the file is selected, the block number is registered in reading combo box.

(4) Input of block number

- ① Input by combo box
Push marked ▼ and select the block number by the mouse.
- ② Input by key
 - Key input mode is made by tab key or mouse clicking of the combo box.
 - Key input is performed by keyboard and push the enter key.

③ Error

When unregistered block number is inputted by key, the following message is appeared and it can not be inputted.

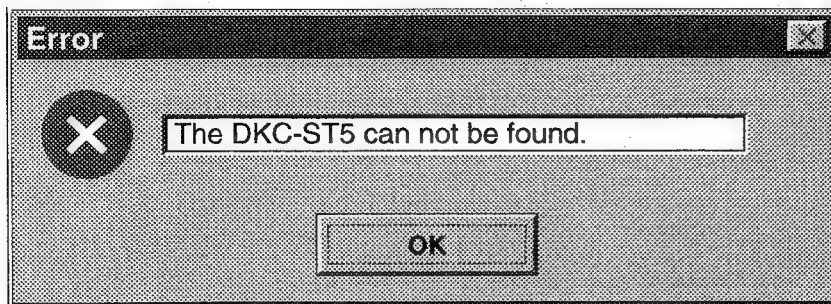

(5) Transmission of defect data

Click the send button and then the defect data is sent to the DKC-ST5.

(6) Finish of application

Click the finish button and then the application is finished.

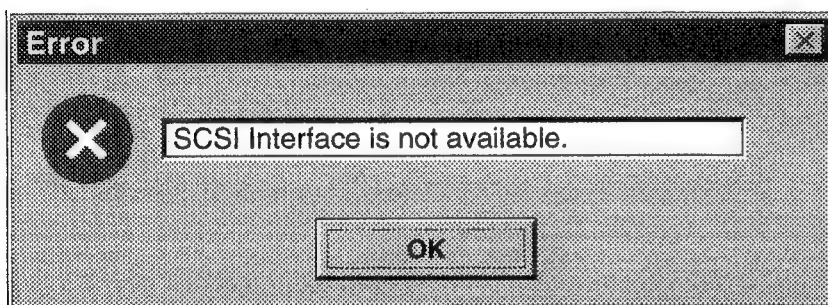

2-5-3. DKC-ST5 INTERFACE

When above message is appeared, DKC-ST5 is not connected to SCSI.

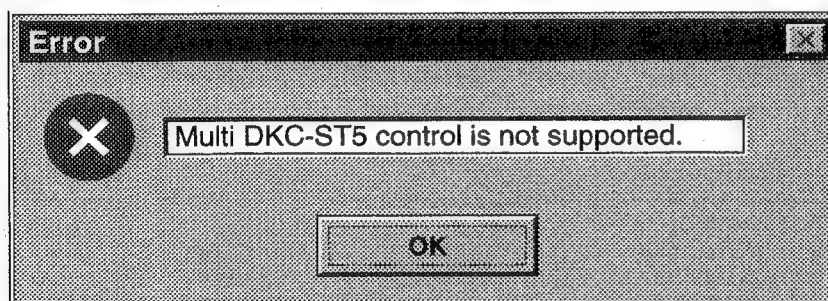

Cause:

- It is not the DKC-ST5.
- The cable is not connected.
- There is a mis-setting of SCSI ID.

When above message is appeared, ASPI driver of 32 bit is not there.

Reinstall the SCSI manager.

When above message is appeared, some DKC-ST5 sets are connected to SCSI.
Connect only one DKC-ST5 to SCSI.

In case, these SCSI interface errors are appeared, SEND button can not be used.

SECTION 3 ALIGNMENT

3-1. PREPARATION

3-1-1. Equipment Required

- Digital voltmeter
- Oscilloscope (100 MHz or more)
- Monitor

3-1-2. Connection

3-1-3. Adjustment mode

Turn on the power and press the **ENTER** key of the remote control more than 5 seconds. The characters on the monitor are changed to green color.

This means that has been entered the adjuntment mode.

[MAIN]
▶EVR ADJUST
IRIS ADJUST
SW SETTING
SHUTTER

3-1-4. Iris Setting

Coincide the cursor to IRIS ADJUST by **↓** key and press the **ENTER** key.
Indication on the monitor is as follows.

[IRIS ADJUST]
CLOSE :
F5.6 : 0
5600K : 0
x3 : 0
▶▷RETURN

Coincide the cursor to F5.6 by **↓** or **↑** key and press the **ENTER** key.

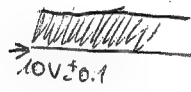

Change the number 0 to -3 by **↓** key and press the **ENTER** key.

Coincide the cursor to ▷RETURN by **↓** or **↑** key and press the **ENTER** key
to return the previous picture.

3-2. VSUB ADJUSTMENT (TG-180)

Conditions for adjustment	spec.	Adjustments
CCD imager voltage <i>U. Ref von Datenblatt</i>	TP3 0±0.1V R-ch	RV4
	TP5 -0.5±0.1V G-ch	RV5
	TP7 0±0.1V B-ch	RV6

3-3. RG DC ADJUSTMENT

Conditions for adjustment	Spec.	Adjustment
clamp pulse voltage  10V±0.1 <i>EW</i>	TP2 10±0.1V R-ch	RV1
	TP4 10±0.1V G-ch	RV2
	TP6 10±0.1V B-ch	RV3

3-4. TERMINOLOGY DEFINITION

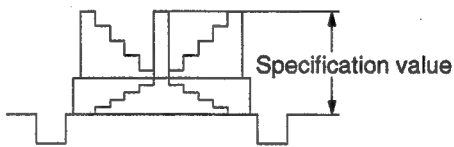

SHADING	Select the CLOSE in the IRIS ADJUST or cover the lens with lens cap.
STANDARD	Select the F5.6:-3 in the IRIS ADJUST and shoot the gray scale.
THE THREE TIMES INTENSITY OF RADIATION	Select the x3:0 in the IRIS ADJUST and shoot the gray scale.
ENTIRELY WHITE	Select the F5.6:-3 in the IRIS ADJUST and contact the lens to the pattern box(white). Lens focus(∞), Zoom is end of tele.
OSCILLOSCOPE TRIGGER	When seeing by H synchronization, ---TP2 When seeing by V synchronization, ---TP1

3-5. EVR INITIALIZATION

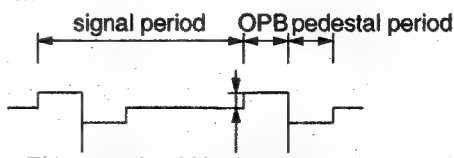

Select the EVR ADJUST and select the INIT.

Change indication to YES by  and  keys, and press the **ENTER** key to initialize the EVR.

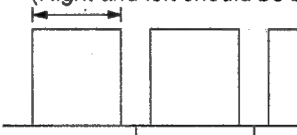

3-6. INPUT LEVEL ADJUSTMENT

Conditions for adjustment	spec.	Adjustments
Mode: standard White level (H synchronization)	TP201 115 ± 10 mVp-p G-ch TP101 120 ± 10 mVp-p R-ch TP301 60 ± 10 mVp-p B-ch 	●RV202 ●RV103 ●RV302

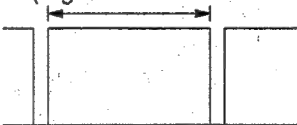

3-7. DARK ADJUSTMENT

Conditions for adjustment	spec.	Adjustments
Mode: Shading White level (H synchronization)	TP503 Within ± 10 mV G-ch TP403 Within ± 10 mV(Without noise) R-ch TP603 Within ± 10 mV B-ch  This step should be become to 0.	●EV19 ●EV7 ●EV31

3-19. V SAW ADJUSTMENT (ALL PIXELS)

Conditions for adjustment	spec.	Adjustments
Mode: Entirely white (V synchronization)	<p>TP505 The difference between white levels Within ± 20 mV(without noise)</p> <p>Should be flat. (Right and left should be balanced.)</p>  <p>The difference between TP405 and TP505. Within ± 10 mV(without noise)</p> <p>The difference between TP605 and TP505. Within ± 10 mV(without noise)</p> <p>Should be flat. (Right and left should be balanced.)</p> 	<p>●V SAW(G-ch)</p> <p>●V SAW(R-ch)</p> <p>●V SAW(B-ch)</p>

3-20. 5600K COLOR TEMPERATURE CONVERSION SETTING

Cover the lens with C14 filter. Select "5600K:0" at IRIS ADJUST.

Shoot the gray scale chart.

3-21. GAIN ADJUSTMENT (5600K)

Conditions for adjustment	spec.	Adjustments
(H synchronization)	The difference between TP403 and TP503. Within ± 10 mV R-ch	5600K(R-ch)
	The difference between TP603 and TP503. Within ± 10 mV B-ch	5600K(B-ch)

3-22. SETTING VALUE WRITTING

Conditions for adjustment	spec.	Adjustments
The setting value is written in EEPROM.	Select ALL SAVE at EVR ADJUST and press the ENTER key.	ALL SAVE

SECTION 4

CIRCUIT DESCRIPTION

4-1. PROCESSOR SECTION

[1] OUTLINE

The SY-243 board mainly consists of a system block, image processing block, and FF clock circuit block.

The system block is constituted by 1M-bit EPROM x 2 (IC39 for lower EPROM and IC40 for upper EPROM) for a program; 4M-bit DRAM (IC27) for system working; nonvolatile 64K-bit EEPROM x 2 (IC22 and IC23); 2M-bit flash memory (IC24) required to load an external program in future; a system controller gate array (IC31) with a character generation function that displays characters on the monitor by using an address decoder, PI/O decoder, DMA timing controller, programmable wait generator, 10-bit programmable counter, C-sync detector, and 1M-bit SRAM (IC32); a peripheral circuit of CPU (IC19) such as IC29 for a real-time clock, IC25 for an RS-232C controller, and an RS-232C driver (IC21); and CPU (IC19) that controls the peripheral circuit.

The image processing block is constituted by a gate array (IC500), incorporating a lookup table (LUT), that can write the image data in VRAMs (IC509 to IC514) for monitor output and that can write and read the input image in and from frame memory (16M-bit DRAM x 3 (IC506, IC507, and IC508))(DMA transfer); gate arrays (IC501 and IC502) that interpolate the slantly shifted pixel image and have a contrast and sharpness function; a gate array (IC503) that can read the image data from VRAMs (IC509 to IC514) for monitor output, that can write and read the data from 4M-bit DRAMs (IC515, IC516, and IC517), and that incorporates a masking function and monitoring lookup table (LUT); SPC (IC504) for SCSI; and an active terminator (IC505).

The FF clock circuit block is constituted by IC100, digital delay lines (IC101, IC102, and IC103), and a sync separator (IC104), so as to generate the WCK clock (20 MHz) locked to the WHD clock from a camera head.

[2] SYSTEM BLOCK

(1) Address decoder, PI/O decoder, and PI/O

The memory map and I/O map consist of system controller gate array IC31, and IC1, IC2, IC3, IC4, and IC5 (refer to pages 4-3 to 4-5).

The $\overline{\text{OUT1}}$ to $\overline{\text{OUT5}}$ output signals of IC31 are input to the CK and input pins of IC28 and IC7, and the CK pins of IC37, IC30, IC529, and IC38, respectively. The $\overline{\text{IN1}}$ to $\overline{\text{IN4}}$ output signals of IC31 are input to the $\overline{\text{1G}}$ and $\overline{\text{2G}}$ pins of IC26, IC36, IC35, and IC34, respectively to obtain the PI/O configuration shown on page 4-6 and control the system.

(2) Character generator

The character generator consists of system controller gate array IC31, 1M-bit SRAM IC32, and IC33.

The characters and lines such as menu, headline, chin line, and print frames displayed on the monitor are written in IC32 from CPU (IC19)(1-bit 768 pixels x 682 lines x 2 are provided as a character image) and output from the CR KEY, CR R, CR G, and CR B pins. The CR KEY signal corresponds to the CR R + CR G + CR B signals.

These four signals are superimposed on a picture signal in the former stage of a D/A converter on the ADA-52 board and output from the monitor.

(3) Interrupt controller

The interrupt controller consists of IC26, IC28, IC5, IC6, IC7, IC10, and IC11.

The $\overline{\text{INTP01}}$ input signal of IC19 is set low and recognized as an interrupt when the $\overline{\text{HK INT}}$ signal at the falling edge in IC501 or the $\overline{\text{FM INT}}$ signal of IC500 is set low or when the $\overline{\text{LM INT}}$ signal of IC503 is set low. The type of the above three interrupts that occurred can be recognized by reading $\overline{\text{IN1}}$ data. (Refer to page 4-6)

(4) Real-time clock block

The real-time clock block consists of IC29, BH1, D2, Q1, and Q2.

The power of IC29 is backed up by BH1 during the power-off sequence. In addition to a timer function, IC29 also has internal SRAM. Therefore, IC29 memorizes the zoom, focus, and iris values of a lens.

[3] FF CLOCK CIRCUIT BLOCK

This block consists of two 20-MHz crystal oscillators; IC100; digital delay lines (IC101 and IC102), and IC105, IC108, and IC107; IC103 and IC106; a sync separator (IC104); and IC105, IC111, IC114, IC110, IC108, IC109, and IC107.

IC100 has a function that gate-delays a clock of 20 MHz, generates a multi-phase clock, compares the clock with the $\overline{\text{WHD}}$ signal from the camera head in phase, and selects a clock with the nearest phase. The digital delay lines (IC101 and IC102), and IC105, IC108, and IC107 are used to eliminate the noise in an output clock of 20 MHz. IC103 and IC106 are used to adjust the phase level for an input picture signal. The sync separator (IC104) detects the $\overline{\text{WHD}}$ signal from the camera head. The WEXT output signal of IC31 is set high if a $\overline{\text{WHD}}$ signal exists (that is, the connection with the camera head is performed using a cable) when the output signal of IC104 is input to the WCSNC pin of IC31. The WEXT output signal is set low if no $\overline{\text{WHD}}$ signal exists (that is, the connection with the camera head is not performed using a cable). However, when connection is done using the WEXT output a signal, WEN and XHD signals are used as WEN and $\overline{\text{WHD}}$ signals from the camera head, and a clock of 20 MHz is synchronized at the falling edge of a $\overline{\text{WHD}}$ signal. When no connection is done using the WEXT output signal, a WEN signal is generated by the RFLD signal from the ADA-52 board and an XHD signal is used as an $\overline{\text{RHD}}$ signal. A clock of 20 MHz is selected by IC105, IC111, IC114, IC110, IC108, IC109, and IC107 so that it is synchronized at the falling edge of an $\overline{\text{RHD}}$ signal.

In addition to WEN and $\overline{\text{WHD}}$ (reference signal of IC500) signals, a $\overline{\text{WVD}}$ signal (write reference signal of IC19) is output as a sync signal from the camera head. Moreover, a flash OUT signal that controls the solid state relay (IC1) on the MB-725 board, and TXD and RXD signals that are used for communication with the camera head CPU are output. The TXD and RXD signals are a differential signal. They conform to the RS-422 standard. These signals exchange each data via differential driver IC17.

Address	Device	Block No	$\overline{\text{CS}}$	Wait	Access byte

Notes:

1. The C/BW SEL signal selects whether to output RET video, video OUT, and S OUT signals as a color or black-and-white signal. The C/BW SEL signal is set high during normal operation.
2. The SOG signal selects whether to superimpose a C-SYNC signal on the G OUT signal of R, G, and B OUT signals.
3. The RT SEL 0 through 3 signals change when a WEN signal is synchronized.
4. The RN SEL 0 through 3 signals change when an HD signal is synchronized.
5. Addresses BF880027H through BF88002FH are set to 0 after POC.
6. The raw data signal is set to 1 when raw data is transferred by SCSI. For other operations, this signal is set to 0.
7. EXT YES/NO indicates whether the camera is connected. Camera connected = High (1)
8. The RELAY ON signal is set to 1 when relay RY1 on the MB-725 board is turned on. It is set to 0 when relay RY1 is turned off.
9. RT SEL 3 through 0 : 0, 1, 2 through 9, A through F
RN SEL 3 through 0 : 0, 1, 2 through 9, A through F

[4] IMAGE PROCESSING BLOCK

(1) Live image display

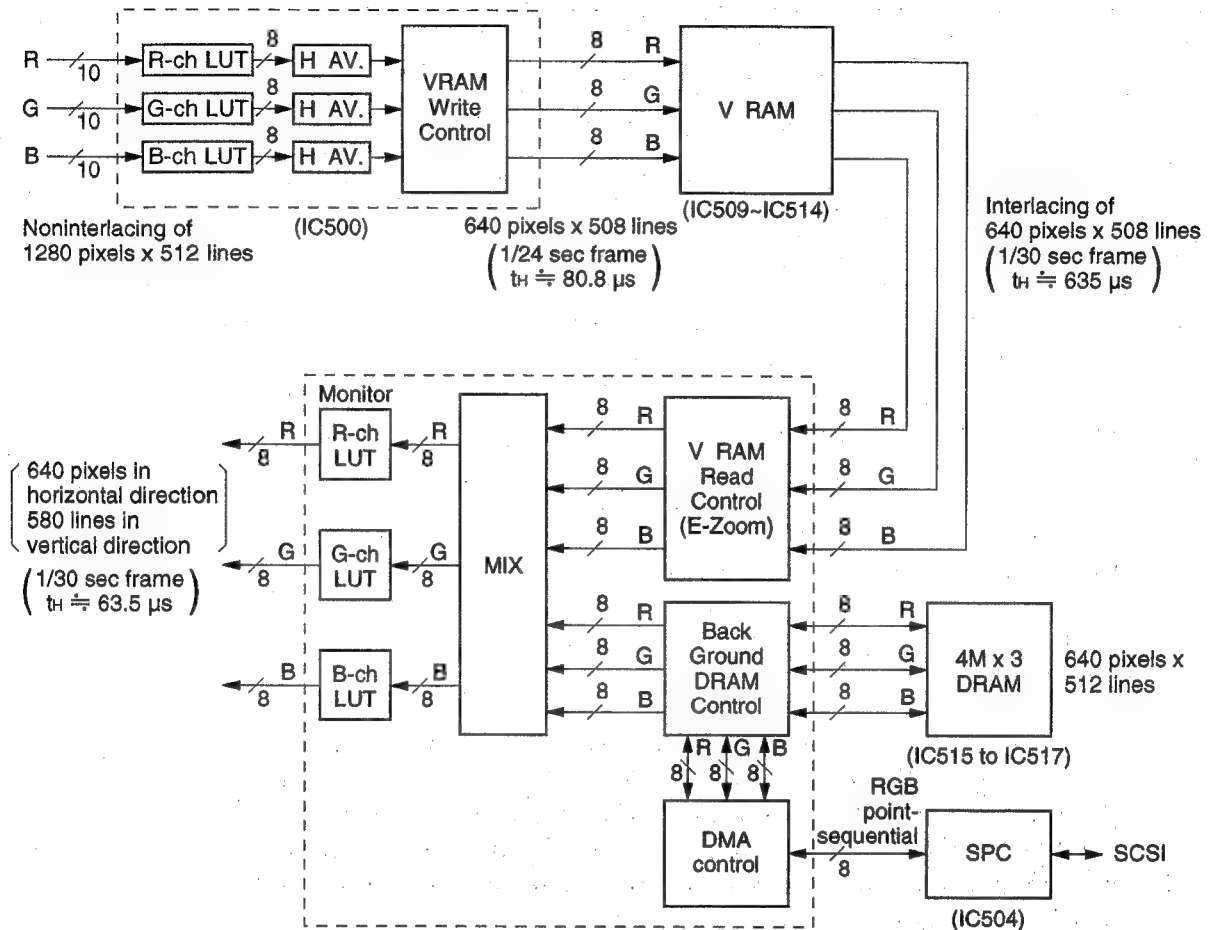

Fig. 4-1 Flow of Image Data in Live State

In the DKC-ST5, the entire pixel read mode (effective pixel of 1280 pixels x 1024 lines) and the twice normal speed mode (effective pixel of 1280 pixels x 512 lines) in which the sum of two lines is output are provided as the CCD read mode. In the live state, data is read in the twice normal speed mode.

Two-line average analog R, G, and B signals are output from the camera head, passed through an analog circuit such as a differential amplifier, cable compensation circuit, sample-and-hold circuit on the processor side, and converted from analog to digital using an A/D converter (the processing described above is performed on the ADA-52 board). The resultant signals are sent to the SY-243 board, latched using a clock of 20 MHz by IC518, IC519, IC520, and IC521, and input to IC500. In IC500, these signals are then passed through a 10-bit lookup table and converted into eight-bit R, G, and B signals, respectively. The converted signals are equalized in the horizontal direction by two pixels and alternately written in VRAMs (IC509 through IC514) for every line in the order of odd, even, and odd.

The picture size is 640 pixels x 508 lines, 1/24 sec frame (WEN period), and $t_{H} \approx 80.8 \text{ usec}$ (XHD ($\overline{\text{WHD}}$) period). The throughput rate is 20 MHz.

For configuration of VRAM, IC509 is used for an R-channel odd field, IC510 for an R-channel even field, IC511 for a G-channel odd field, IC512 for a G-channel even field, IC513 for a B-channel odd field, and IC514 for a B-channel even field.

The image from VRAM is read by IC503. The normal live image is input from MRO through 7, MGO through 7, and MBO through 7 pins to IC503 and output from MRO0 through 7, MGO0 through 7, and MBO0 through 7 pins through R-, G-, and B-channel lookup tables for a monitor. The image data is then passed through a buffer consisting of IC537, IC538, and IC539 and character-superimposed on the ADA-52 board. After that, the image data is displayed on the monitor through a D/A converter, RGB encoder, and 75Ω driver. The image from VRAM is read in picture size of 640 pixels x 508 lines, 1/30 sec frame (double period of $\overline{\text{RVD}}$), and $t_{H} = 63.5 \text{ usec}$ ($\overline{\text{RHD}}$ period), and at a throughput rate of 12.283 MHz. For $\text{RFLD} = 0$, the image is read from the odd memory of VRAM by interlacing. For $\text{RFLD} = 1$, it is read from the even memory of VRAM by interlacing. The image from VRAM is written and read independently. In other words, VRAMs (IC509 through IC514) are used as buffer memory for rate conversion.

The center of the monitor screen becomes double when the E-zoom key on the remote control unit is pressed. In this case, one-pixel data is simply expanded in the horizontal and vertical directions by two pixels. The expansion is performed in IC503 during read operation.

A background image is described below.

The background image memory consists of three 4M-bit DRAMs (IC515 for R channel, IC516 for G channel, and IC517 for B channel). The image memory is input through SPC (SCSI protocol controller) IC504 in a processor to the ID0 to ID7 pins of IC503 when an image of 640 pixels x 512 lines x R.G.B is point-sequentially transferred from a computer by SCSI. IC504 and IC505 (point-sequential DMA) are subject to handshaking by $\overline{\text{DREQ}}$, $\overline{\text{DACK}}$, and $\overline{\text{DBWR}}$ control signals. The background image data sent to IC503 is written in IC515 through IC517 described above.

The written image data is synchronized with the read timing of VRAM when the fame ON/OFF key on the remote control unit is pressed ($\overline{\text{RVD}}$ synchronization in the vertical direction, $\overline{\text{RHD}}$ synchronization in the horizontal direction, and throughput rate of 12.283 MHz). In this case, even lines (0, 2, 4, etc.) for $\text{RFLD} = 0$ or odd lines (1, 3, 5, etc.) for $\text{RFLD} = 1$ are read from DRAMs (IC515 through IC517) to the DR0 through 7, DG0 through 7, and DB0 through 7 pins in the high-speed page mode (interlacing).

In IC503, the average data (mix data) for VRAM image data is passed through a lookup table for monitor and output from the MRO0 through 7, MGO0 through 7, and MBO0 through 7 pins.

(2) Memory image display and capture

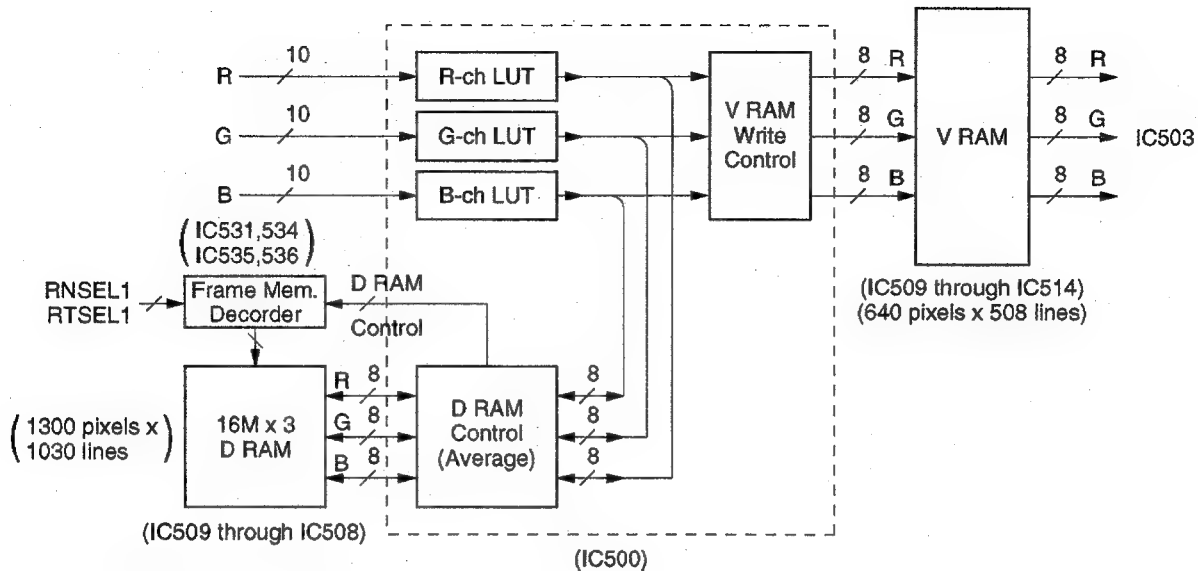

Fig. 4-2 Flow of Image Data during Memory Image Display and Capture

The CCD read mode of the camera head is put into the entire pixel read state to transfer only one frame when the release key on the remote control unit is pressed. When RT SEL0 to 3 signals are set to 1 (refer to page 4-6) at that time, the entire pixel data is sent from the ADR0 through 9, ADG0 through 9, and ADB0 through 9 input pins to IC500 and passed through R-, G-, and B-channel lookup tables. In synchronization with WEN, XHD ($\overline{\text{WHD}}$), and ADCK (20 MHz clock) signals, the pixel data is then written in IC506 (R channel), IC507 (G channel), and IC508 (B channel) in the high-speed page mode. The RNSSEL0 through 3 and RTSEL0 through 3 data that latch the DRAM control signals, output from IC500, (XRTC (set low during image memory capture or clear operation), XRFC (set low during image memory refresh), $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{OE}}$, $\overline{\text{WER}}$, $\overline{\text{WEG}}$, $\overline{\text{WEB}}$, and DIR (determines the data bus direction of image memory)) by IC529 and IC530 are decoded (by IC531 and IC532). Moreover, RNSSEL1 and RTSEL1 signals are generated, and the DRAM control signal described above is decoded by the RNSSEL1 and RTSEL1 signals. As a result, image memory consisting of IC506, IC507, and IC508 is controlled (by a frame memory decoder consisting of IC531, IC534, IC535, and IC536 shown in Fig. 4-2). During write operation, the RTSEL1 signal is set to 0, and the RNSSEL1 signal to 1 (the RNSSEL1 and RTSEL1 signals are set to 1, respectively during normal operation). The size of the written image is 1300 pixels x 1030 lines.

The memory image display is described next.

For review during capture operation, the entire pixel data from the camera head is decimated as shown in Fig. 4-3 and written (alternately for every odd and even line of VRAM) in VRAM simultaneously with when it is written in image memory consisting of IC506, IC507, and IC508.

When the live/memory key on the remote control unit is pressed and memory 1 is selected, RNSEL0 through 3 signals are set to 1 (refer to page 4-5) and the RNSEL1 signal shown in Fig. 4-2 is set low (the RTSEL1 signal is set high). At that time, the image data (with image size of 1280 pixels x 1016 lines) of IC506 through IC508 are read and input to IC500. In IC500, 2 x 2 pixel data items are equalized as shown in Fig. 4-4 and alternately written in VRAM for every odd and even memory line.

Fig. 4-3 Decimated Data during Review

Fig. 4-4 Average Data during Memory Image Display

(3) DMA data transfer

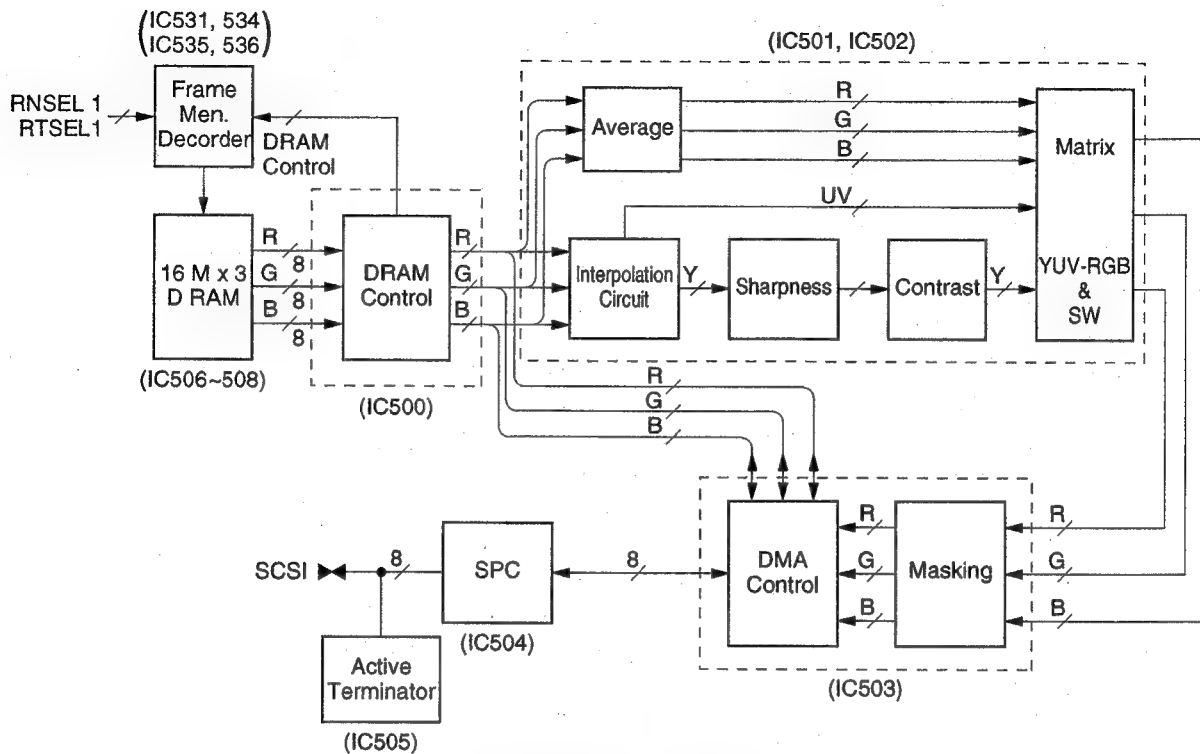

Fig. 4-5 Flow of Image Data during DMA

1) Full image transfer (2560 pixels x 2048 lines x R.G.B)

Nine image memories (including the eight image memories on the ADA-52 board) are provided. **RTSEL0** through 3 signals are set to 1 (refer to page 4-6) when the image memory on the SY-243 board is selected. **DRAM control signals** (**XRFC**, **XRTC**, **RAS**, **CAS**, **OE**, **WER**, **WEG**, **WEB**, and **DIR**) are decoded using a frame memory decoder consisting of IC531, IC534, IC535, and IC536 so as to select and control IC506, IC507, and IC508. The **R**, **G**, and **B** data (1300 pixels x 1030 lines) of image memory 1 are passed through IC500 and transferred in the handshaking (asynchronous) state by IC501, **REQ** and **ACK** signals. The eight-bit **R**, **G**, and **B** image data items input to IC501 are first interpolated in IC501. In the camera head, the **R**, **G**, and **B** CCDs are fixed with the **R** and **B** channels obliquely shifted for a **G** channel by a half pixel.

By interpolating the eight-bit R, G, and B image data, however, the image size is made double in the vertical and horizontal directions from 1300 pixels x 1030 lines to 2600 pixels x 2060 lines. As a result, the resolution is improved (1400 TV lines).

For the interpolation block processing in Fig. 4-5, the R, G, and B signals are converted into luminance signal Y and color-difference signals (R-Y) and (B-Y) so as to interpolate the Y signal. The interpolated Y signal is processed in sharpness and contrast blocks, converted into R, G, and B signals, and output from IC501.

To avoid the influence of FIR filter in IC501, the image is cut in the upper and lower, and right and left portions. The size of the obtained image is 2580 x 2056. The sharpness and contrast blocks have parameters that enable control operation. (In the menu, the sharpness can be set in the range of off, low, mid, and high, and the contrast can be selected in the range of -5 to +5.)

The R, G, and B image data output from IC501 are transferred for IC503 in the handshaking and asynchronous states by REQ and ACK signals and input to IC503. In IC503, masking (in which hue, saturation, and brightness can be adjusted) is performed. The masking block has parameters that enable control operation (in the menu, the masking can be selected in the range of off, low, mid, and high). The R, G, and B output signals are converted into R, G, and B point-sequential data by a DMA control block and transferred in the handshaking and asynchronous states between the DAM control block and SPC (IC504) by REQ and ACK signals. Moreover, R, G, and B point-sequential image data items (2560 pixels x 2048 lines) are transferred from IC504 to the computer between a processor and computer via an SCSI bus.

In IC503, 2560 pixels x 2048 lines are clipped from the image size of 2580 x 2056 for data transfer.

2) Index image transfer (320 pixels x 256 lines x R.G.B)

The index image transfer is basically the same as a full image transfer except that, in IC501, an index image is output through an average circuit. For 320 pixels x 256 lines, the average data of 16 pixels in all (4 pixels each in the horizontal and vertical directions) is output by one pixel. The image size is 1280 pixels x 1024 lines in the output block of IC500, 320 pixels x 256 lines in the output block of IC501, and 320 pixels x 256 lines in the output block of IC503. In other words, the clip operation that is performed in IC501 and IC503 during full image transfer is not carried out during index image transfer. No sharpness and contrast processing are also performed.

3) Raw image transfer (1300 pixels x 1030 lines x R.G.B)

During raw image transfer, the raw image captured by image memory is directly output to SCSI without sharpness, contrast, and masking processing.

The raw image skips IC500 to IC501 (IC502) as a pass and is directly transferred to IC503. In the same way as described previously, it is transferred in the handshaking and asynchronous states by REQ and ACK signals. Both read and write operations are performed only during raw image transfer, that is, the raw image is transferred in two ways.

For the asynchronous handshaking transfer using REQ and ACK signals, the REQ signal is output from the data transmission side, and the ACK signal is output from the data reception side. However, between IC504 and IC503, the REQ signal is output from IC504, and the ACK signal is output from IC503.

[5] CIRCUIT DESCRIPTION OF ADA-52

(1) Outline

The ADA-52 board mainly consists of an A/D block, D/A block, memory block, and PLL block.

The A/D block is constituted by a floating video amplifier circuit, cable compensation amplifier circuit, bias amplifier (CXA1399), DC level shift circuit, and A/D converter (SPT7855).

The D/A block is constituted by a D/A converter, low-pass filter, RGB encoder (CXA1645), video amplifier, and 75 Ω driver.

The memory block is constituted by 16M-bit DRAM for eight image memories and a frame memory decoder.

The PLL block is constituted by a sync signal generator (CXD1159) that generates a timing pulse and clock (12.288461 MHz) for monitor display, phase comparator (TC8051), TL082 for a low-pass filter amplifier, and voltage-controlled crystal oscillator (VCO)(24.576 MHz).

(2) A/D block

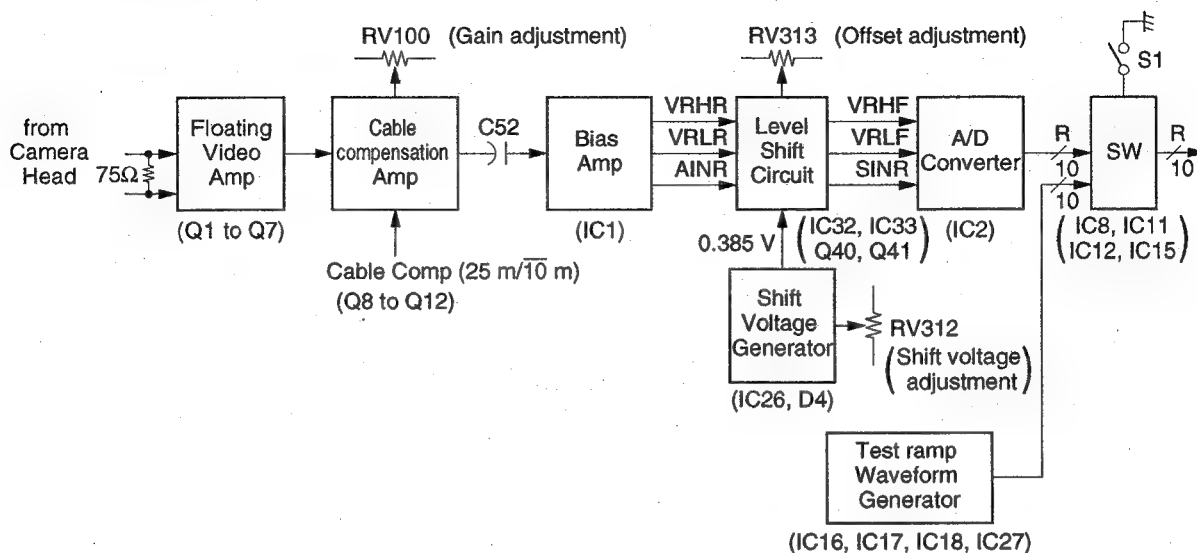

Fig. 4-6 Block Diagram of A/D Block

The A/D block is described based on an R-channel circuit below. (G- and B-channel circuits are the same as for the R-channel circuit.)

The video amplifier in the initial stage has a floating structure so as to cancel the potential difference of ground (GND) from a signal line and cancel the in-phase noise between the signal line and GND when a potential difference occurs between the camera head of DKC-ST5 and the processor.

The cable compensation amplifier in the second stage contains a low-pass filter in the feedback block. The attenuation occurring when the camera cable between the camera head and processor is 10 m or 25 m is compensated so that it is flat in the input block of a bias amplifier (IC1) by switching the effect of the low-pass filter using FET (Q12).

The level of a signal input to the A/D bias amplifier (IC1) is also gain-adjusted by RV100. Bias amplifier IC1 samples and holds a signal, amplifies a signal to about three times as high, and generates a reference voltage for an A/D converter.

To match the DC characteristics of the reference voltage between the bias amplifier (IC1) output and A/D converter (IC1) input, the level shift circuit and shift voltage generator generate a voltage of 0.385 V (adjusted by RV312), decrease the DC voltage level by 0.385 V, and input the voltage to the A/D converter.

Moreover, offset adjustment is performed for the DC level fine-adjustment of a signal by RV313.

A ramp waveform generator is mounted for adjustment on the ADA-52 board. The image signal from the A/D converter and the test ramp waveform can be switched using switch S1 on the front end of the board.

A 10-bit sampling signal of 20 MHz is output from the A/D converter.

(3) D/A block

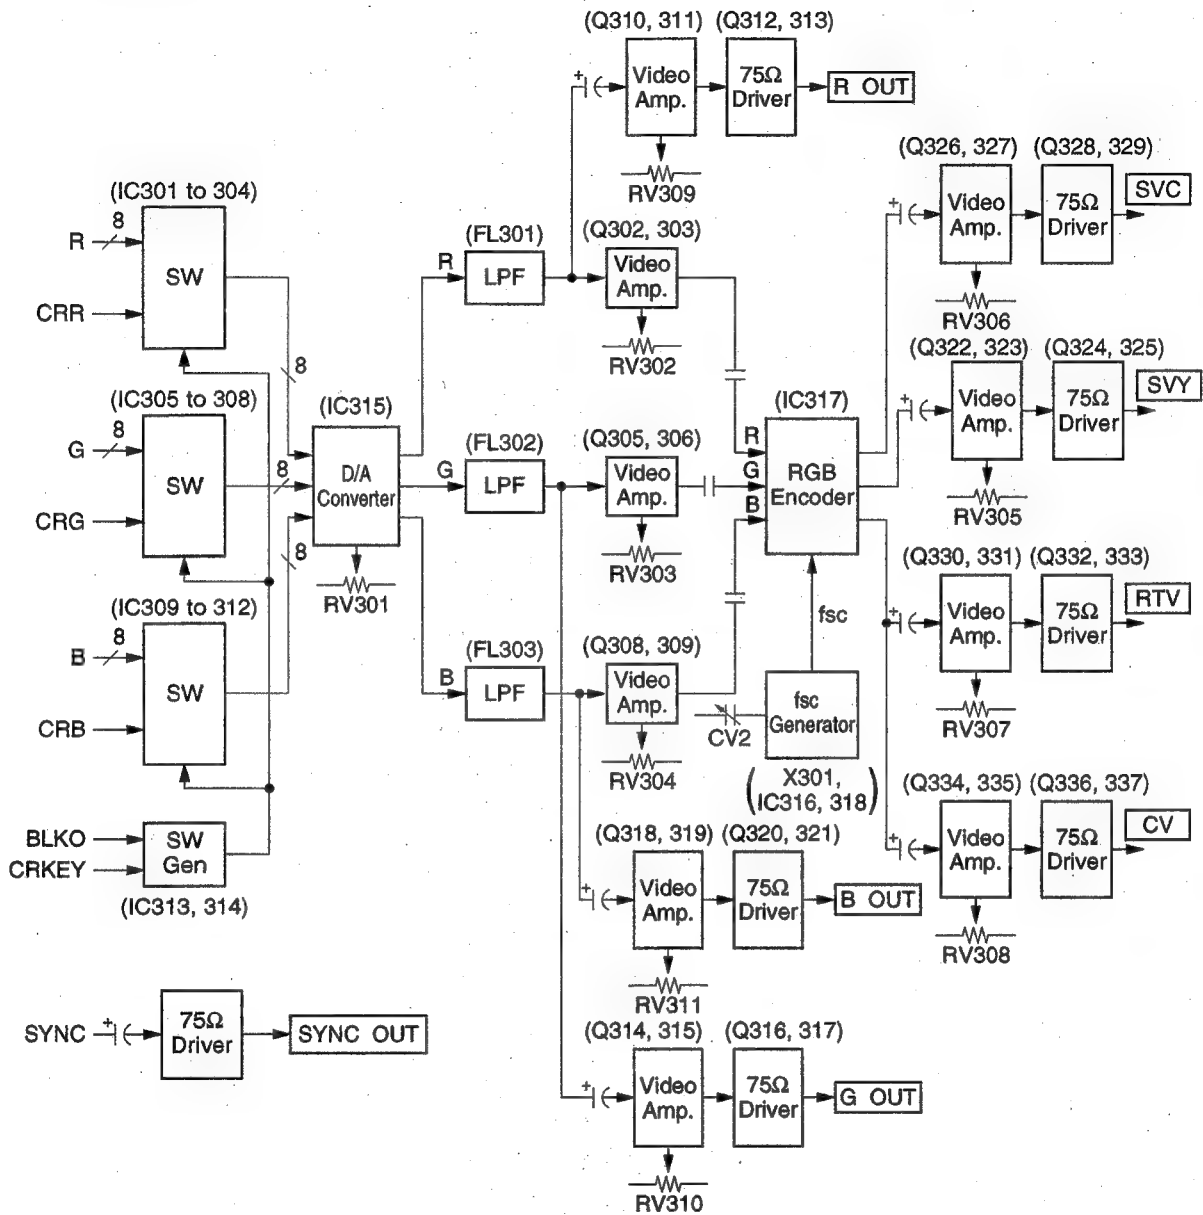

Fig. 4-7 Block Diagram of D/A Block

The D/A block is described next.

The eight-bit R, G, and B signals on the left of Fig. 4-7 are the display image data (live and memory images) from the SY-243 board. CRR, CRG, and CRB are one-bit data for menu display (e.g., character display). BLKO is a blanking signal indicating whether it is a video period. CRKEY is a character signal indicating whether character data exists. In the switch generation block, the switch block is controlled, and the CRR, CRG, and CRB signals are selected when the BLKO and CRKEY are used. When BLKO and CRKEY signals are used, R, G, and B signals are selected and input to the D/A converter. RV301 is used to adjust the maximum amplitude value of a D/A output signal. The resultant signal is converted from digital to analog using the D/A converter. The converted analog R, G, and B signals are input to low-pass filters FL301, FL302, and FL303 to eliminate the reflected components. The cut-off frequency is 6 MHz.

The output signal of the low-pass filters is cut in a DC component and output through a video amplifier and 75 Ω driver to the RGB monitor. For a SYNC OUT signal, the composite sync signal generated in the PLL block is cut in a DC component, and the resultant signal is output through a 75 Ω driver. RV309, RV310, and RV311 are used to adjust the gains of R, G, and B output signals.

Moreover, the output signal of the low-pass filters is passed through a video amplifier, cut in a DC component, and input to RGB encoder IC317. RV302, RV303, and RV304 are used to adjust the gains of the R, G and B signals that are input to the RGB encoder.

RGB encoder IC317 generates and inputs a subcarrier of 3.579545 MHz using an fsc generator. The fsc frequency is adjusted using trimmer capacitor CV2. An S-video Y signal, C signal, and composite video signal are then output as an output signal of the RGB encoder. Each signal is output as a monitor signal of the S-video Y signal, C signal, and composite video signal and a return video signal to the camera head through a video amplifier and 75 Ω driver. RV305, RV306, RV307, and RV308 are used to adjust the gains of S-video Y, S-video C, return video, and composite video signals.

(4) Memory block

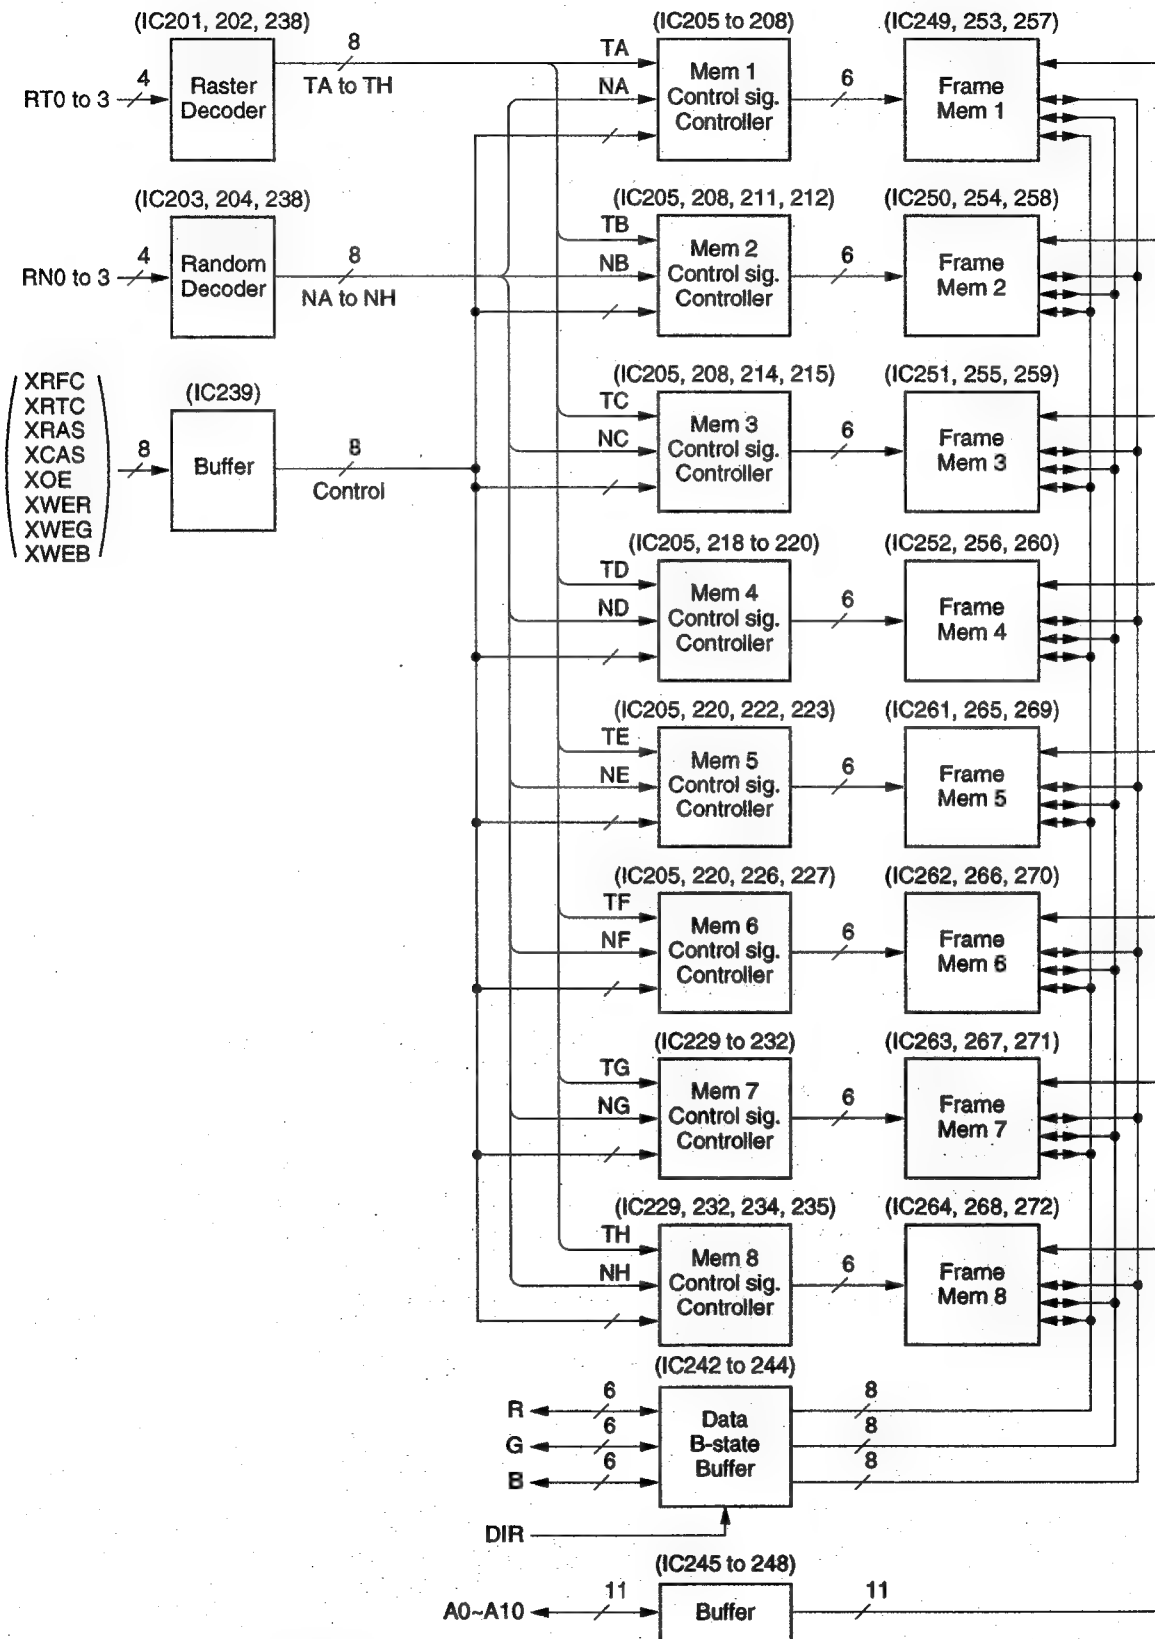

Fig. 4-8 Block Diagram of Memory Block

The memory block is described based on Fig. 4-8.

The memory block uses three 16M-bit DRAMs (R, G, and B) and constitutes eight frame memories.

The RT0 through 3 signals on the left of Fig. 4-8 are used to select the type of memory in which the image signal from the camera head is memorized. RN0 through 3 signals are used to select the type of memory to be displayed, the contents of memory to be transferred to a computer, and the type of memory in which image data is written from a computer.

The actual memory selection is shown in the table below.

RN3 RT3	RN2 RT2	RN1 RT1	RN0 RT0	Description
0	0	0	0	stand-by
0	0	0	1	SY-243 Memory
0	0	1	0	Frame Mem. 1
0	0	1	1	Frame Mem. 2
0	1	0	0	Frame Mem. 3
0	1	0	1	Frame Mem. 4
0	1	1	0	Frame Mem. 5
0	1	1	1	Frame Mem. 6
1	0	0	0	Frame Mem. 7
1	0	0	1	Frame Mem. 8
1	0	1	0	NOP
1	1	1	1	

Table 4-4 Memory Selection

RT0 through 3 and RN0 through 3 signals are decoded by a raster decoder and random decoder and input to memory 1 through 8 control signal controllers, respectively. XRFC, XRTC, XRAS, XCAS, XOE, XWER, XWEG, and XWEB signals are passed through a buffer as memory control signal and input to the memory 1 through 8 control signal controllers described above. In the eight controller blocks, frame memory 1 through 8 control signals (XRAS, XCAS, XOE, XWER, XWEG, and XWEB) are generated by the output signals of the above two decoders, and XRFC and XRTC signals and input to each memory.

The data bus and address bus are used in common for frame memories 1 through 8.

(5) PLL block

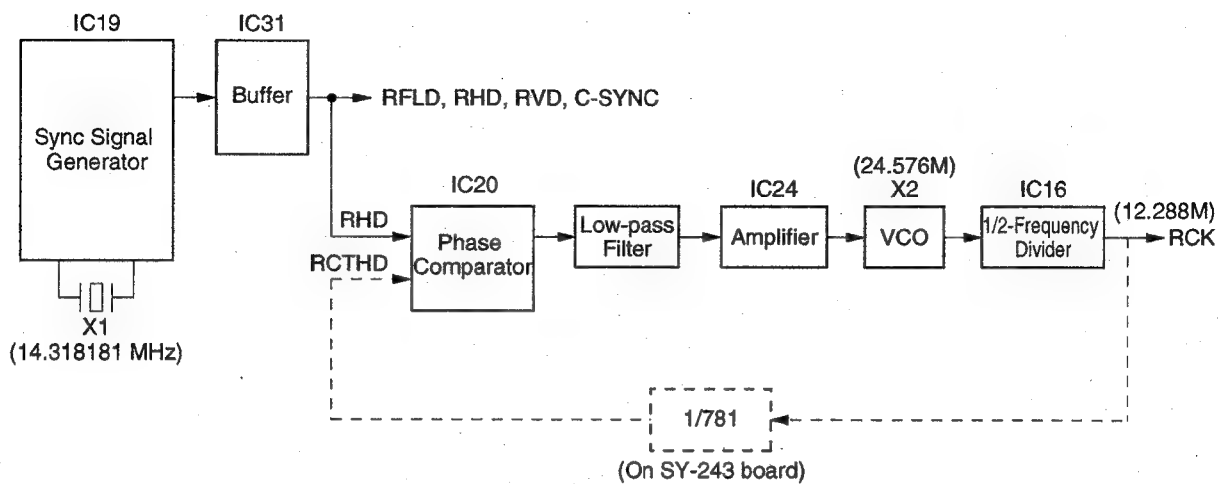

Fig. 4-9 Block Diagram of PLL Block

In the PLL block, the aspect ratio on the monitor is 4 to 3 because the CCD has a square grid. Therefore, the image size is 486 lines in the vertical direction and 648 pixels in the horizontal direction. The PLL block generates an RCK clock (12.288 MHz) that samples the video period of an NTSC signal by 648.

The RFLD, RHD, RVD, and C-sync signals generated using sync signal generator IC19 are passed through buffer IC31 to produce a sync signal for display.

The RCT HD signal generated when an RCK clock is frequency-divided by 781 and the output RHD signal of sync signal generator IC19 is phase-compared using phase comparator IC20 to generate an RCK clock (12.288 MHz). The obtained error signal is passed through a low-pass filter consisting of C and R and input from amplifier IC24 to voltage-controlled oscillator (VCO) X2 (24.576 MHz). The output clock of the VCO is frequency-divided into 1/2 by IC16 to produce an RCK clock of 12.288 MHz. The frequency division of 1/781 is performed on the SY-243 board.

4-2. Camera Section

[1] Description of the imager

The DKC-ST5 uses the 2/3 inch CCD imager ICX085-FL2 that has 1,400,000 pixels.

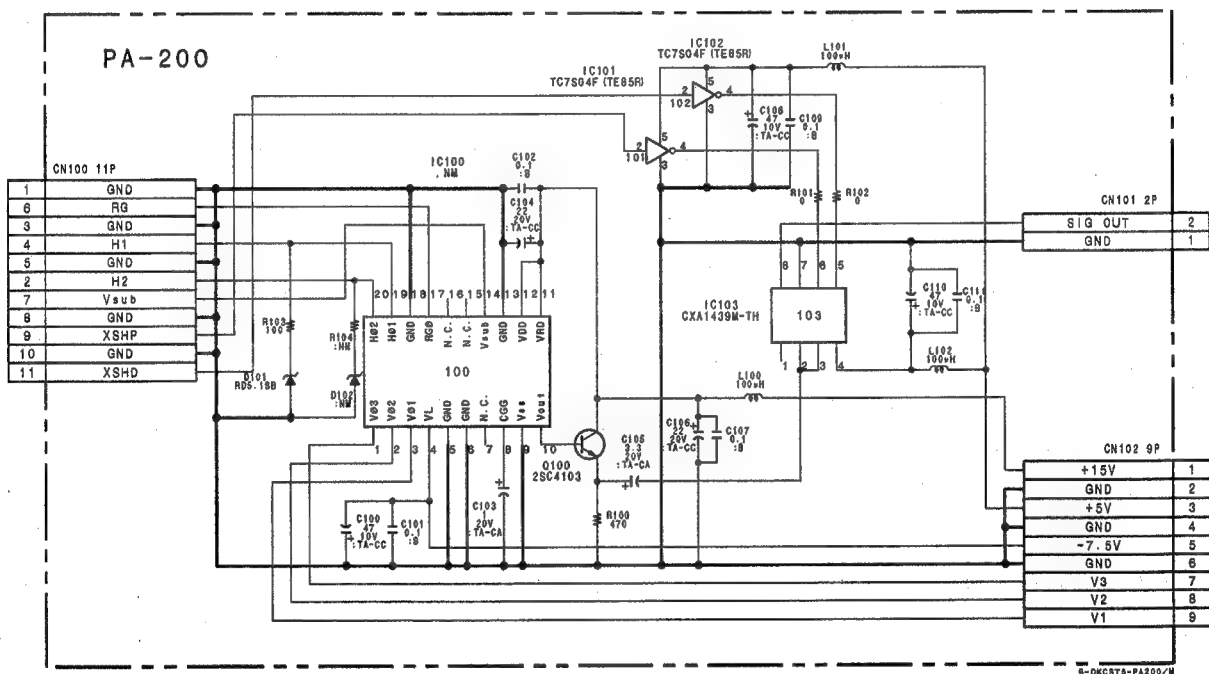

- Picture element 1280×1024
- When taking the still image, entire pixels are read out independently.
(Frame frequency 12Hz, This following indication is entire pixel reading out.)
- The line numbers are decreased to 1/2 by 2 lines addition reading out in live picture mode.
The reading out time is decreased to 1/2 time.(frame frequency is 24Hz, This following indication is twice normal speed reading out.)
- Electronic shutter
- Square grid unit cell

In live image, the video signal reading from CCD imager with frame frequency 24Hz is sent to the processor, and in the processor, the signal is converted analog to digital, and is sent to the memory once. The signal reading from the memory with the frame frequency 30Hz is produced the video signal with NTSC timing equivalent. It is sent to the MONITOR terminal.

[2] PA-200,PA-201 and PA-202 Board

PA board is for attaching to the CCD imager. Power supply to CCD and supply of driving pulse are performed. CDS(CORRELATED DOUBLE SAMPLING) is composed. PA-200, PA-201 and PA-202 boards are same circuit composition. Therefore, PA-200 is only explained.

The driving pulse (H1, H2, RG, V1, V2, V3) and V sub supplied from TG-180 board are sent to CCD imager IC100. The video signal from pin 10 of IC100 is passed through Q100 and inputted to pins 2, 3 of IC103. IC103 is the CDS circuit. Pulse for CDS is supplied from TG-180 board as XSHP and XSHD. They passed through inverter IC101 and IC102 respectively and inputted to IC103. The video signal outputted from pin 8 of IC103 is sent to the PR-228 board.

[3] PR-228 Board

R, G and B signals from PA-200 (B) / 201 (G) / 202 (R) are inputted to the PR-228 board and passed through the 20MHz trap circuit. They are entered to the video amplifier (IC102, 202, 302). The following processes are performed at this amplifier.

- White shading
- Gain control
- Blanking clean
- White balance
- Pre knee

After that, The signals are passed through the gamma correction circuit, knee circuit and drive circuit, and inputted to the processor via MB-724 board.

R-ch, G-ch and B-ch are the same circuit composition. Therefore, R-ch is explained as an example.

(1) Video amplifier from trap filter

The signal passed through CDS circuit on the PR board is inputted to the PR-228 board. This signal (CN101-2) includes CCD driving pulse of 20MHz and coupling noise of sample hold. This signal is passed through 20 MHz trap filter (FL101) to prevent bad condition at the following signal process circuit. After this signal is passed through buffer Q103 and is adjusted the level by RV103. After that, it is inputted to pin 18 of VA IC (IC102 : CXA1486Q). The serial data from microcomputer on the AT-115 board are passed through pin 20 (SCK), pin 18 (S DATA) and pin 16 (LD1) of CN1 and inputted to the D/A converter IC105. The analog signal outputted from the IC105 controls the all sections on the PR-228 board. This control voltage becomes approx. 2.3 V when the data from AT-115 board is 80H, approx. 4.6 V as maximum when the data is FFH, and 0V as minimum when the data is 00H.

(2) Video amplifier

Video amplifier IC (IC102) is explained. IC102 is composed following circuit.

- Black set
- Clamp
- Video amplifier gain switching circuit
- Blanking clean
- White balance circuit
- Pre knee correction
- Shading correction

[Black set]

The black level is decided by optical black level as standard. In case there is the difference between black levels video and optical on the video amplifier gain switching circuit, the black level is fluctuated by switching the gain and the black level component may be added a color. Therefore, the black set signal is added to main line at VA IC (IC102) input. This black set signal cancels the difference. This black set correction signal is made as following. The DARK control signal of pin 6 of IC105 is divided the voltage by R149 and R133. DARK control signal is 2.3 V by standard. R133 becomes approximately 0 V to divide the voltage since it is connected to -2.5 V. The signal is cleaned the GND level by BLK phase at IC103 (1/3). This signal is attenuated by R110 and R111 and inputted to BLACK SHADING control terminal.

When switching the gain, black level change is canceled by adjusting the DARK output with control data from AT-115 board. This adjustment is performed on adjustment mode. In ABB operation mode, The microcomputer on the AT-115 board automatically adjusts it. The OFF-SET of optical black level and blanking level are loosen by adjusting pin 5 (BLACK1) of IC105 on the adjustment mode.

[Clamp]

The signal is clamped to stabilize the DC voltage of video waveform.

[Video amplifier gain switching circuit]

It is available to set the gain from -3 dB to 30 dB as IC. In DKC-ST5, the gain setting is used from 6 dB to 30 dB in LIVE mode according to level diagram and dynamic range. And in STILL mode, 6 dB/12 dB/18 dB/24 dB are used as ISO20/40/80/160 equivalent. The gain is selected by controlling the voltages of pin 19 (GS2) and pin 20 (GS1) with pin 9 (GS1) and pin 12 (GS2) of IC105 output.

The gain is decided by selecting three values(0 V, 2.3 V, 4.6 V) combination.

		GS1		
		4.6 V	2.3 V	0V
GS2	4.6 V	18 dB	-3 dB	24 dB
	2.3 V	12 dB	3 dB	30 dB
	0 V	0 dB	6 dB	9 dB

[BLANKING clean]

The black level of video signal is fixed at GND level in the blanking period. Like this, blanking cleaning is performed. In this stage, pre-blanking is performed by P BLK pulse.

[White balance circuit]

The output level of IC102 is pin 26 (G-CTRL) input voltage. This is variable approximately more than ± 6 dB continuously. The microcomputer on the AT-115 board controls the output level of IC102. The white balance is adjusted by losing white level difference between G-ch and R-ch, B-ch.

[Pre knee correction]

Pre knee is that the signal is decreased the amplifier gain in more than some level, is compressed and is limited the maximum amplitude to coincide the signal for dynamic range of signal process circuit on rear stage. KNEE-PT control signal of pin 2 output of IC105 is passed through R147, attenuated at R122 and inputted to pin 9 (KNEE-PT) of IC102. Pin 2 output (KNEE-PT) of IC205 is master KNEE point adjustment signal. It is passed through R252 and controls the IC102.

[Shading correction]

The shading may be appeared by the optical system and image pick up devices. In the DKC-ST5, it is performed to correct the white shading. The amplitude and polarity of H SAW signal output of IC103 (3/4) are controlled by the pin 3 (H SAW) output of IC105. The amplitude and polarity of V SAW signal output of IC103 (4/4) are controlled by pin 4 (V SAW) output of IC105. These two signals are mixed at R140 and R141, and is preblanking cleaned at IC101 (2/3) and is inputted to the white shading correction input terminal (pin 2 of IC102). The output of IC102 is controlled the gain by this saw tooth waveform. As a result, white shading is corrected.

Saw tooth waveform appearance of R-ch H SAW is explained as an example.

The H SAW control signal is divided the voltage by R134 and R136, and inputted to the pin 5 of IC103. When pin 9 of IC104 (2/3) is turned ON by CLP2, IC103 becomes voltage follower. Therefore, the pin 7 is the same output as pin 5.

The IC103 is operational amplifier. The pin 5 and pin 6 are the same voltage since input of positive and negative are imaginary shorted. The difference voltage between the pin 5 and H SAW control signal is applied to the R135. And the respond current flows. This current flows between pin 6 and pin 7 as it is since input impedance of pin 6 is infinity. When CLP2 becomes L, pins 3 and 4 of IC104 becomes open, C126 is started to charge by the above current. The charging current is decided by H SAW control voltage. Therefore, the voltage is fixed and voltage change by time is also fixed. The signal that voltage is increased or decreased by fixed ratio is outputted from pin 7. This is the saw tooth waveform. The amplitude and polarity of H SAW waveform is controlled by changing H SAW control voltage since the current is changed by applied voltage to R135.

The V SAW control voltage is switched by the reading out the signal since V period is changed by whether entire pixel reading out or twice normal speed reading out of CCD reading.

(3) Gamma correction circuit

The video signal outputted from pin 7 of IC102 is adjusted the level by RV401, and is passed through Q401 buffer and the amplifier Q402 through Q404. That output is inputted to gamma amplifier input, the base of Q409. It is attached to load resistor R452 and diode D401 to the collector of Q411. D401 has four diodes. Their cathodes are connected to the voltages which are divided by R456, R461, R458, R455, R454 and RV404 through R453, R457, R460, R463. When signal is nothing, the diode is OFF since the cathode voltage of D401 is low. Therefore, the signal is not passed. When the signal is gradually bigger, the diode is conducted from lower voltage one gradually and the signal is outputted. This signal is negative fed-back to Q412 via RV405. When the signal becomes bigger, the quantity of feed-back through the diode become bigger. Therefore, the output gain becomes smaller than signal becomes bigger. The collector signal of Q411 is entered to base of Q413, is attenuated at R467, R465 and R466, is passed through RV405 and is negative fed-back to Q412. The Q413 gamma amplifier output is sample-held by Q414 in the CLP2 period and is fed-back by the operation amplifier IC402 to the emitter of Q410. The voltage of RV406 (R PED) is passed through the voltage follower of IC402 (1/2) to become low impedance. And is entered to minus input of pin 2 of IC402. R PED control signal of pin 8 of IC105 and the master PED control signal of pin 8 of IC205 are mixed at R472, R477 and R478 and entered to the minus input of pin 2 of IC402. The feedback works to coincide this mixed voltage and the voltage of black level that is sample-held by pin 3 of IC402. As a result, the black level is fixed by gamma circuit. Stabilization of gamma process is planned.

(4) Knee

Gamma correction circuit output of Q413 is passed through the buffer Q415 (1/2). This voltage is compared with the voltage that is set by RV407 at Q415 (1/2 and 2/2). When the signal is bigger than setting voltage, Q415 (2/2) becomes ON, the signal is attenuated at R496 and R497. By this mean, the signal of over setting voltage can be attenuated. After that, this signal is passed through buffer Q416, sent to AT-115 board via MB-724 board. And the other side, the signal is sent to 75 Ω driver circuit.

(5) 75 Ω driver circuit

The signal from Q416 emitter is passed through C422, and the buffer Q419 (1/2 and 2/2), entered to base of Q420 (1/2). The output from that collector is sent to the driver circuit that is composed by Q421 through Q424. The output of this driver circuit is fed-back to the base of Q420 (2/2). The output of driver circuit is sent to the MB-724 board and passed through 75 Ω resistor, is sent to the processor.

[4] TG-180

TG-180 includes following circuits.

- Timing generator (TG) (IC5 : CXD2437TQ)
- Sync generator (SG) (IC101 : CXD8843R)
- H driver (IC2 / 3 / 6 / 7 / 10 / 11 : 74AC04SJ)
- V driver (IC4 / 8 / 12 μ PD16502GS)
- High speed electronic shutter pulse generation (IC9 : μ PD16502GS)
- V sub generation
- RG clamp

(1) Timing generator

IC5 (CXD2437TQ) is timing generator (TG) that is developed for CCD imager ICX085. The oscillator is CP1. 40MHz clock is inputted to pin 64 (CKI) of IC5. Some kind of pulses are generated by the clock and HD and VD that are generated by SG. 1/2 frequency divided clock of the oscillator is outputted to pin 51 (CL) and is supplied to SG. Setting of the electronic shutter is performed by serial signals (SDATA, SCLCK, STRBTG) outputted from the microcomputer on the AT-115 board. When the still image is taking, the start timing of reading out is decided by TRIG signal output from the microcomputer on the AT-115 board. The entire pixel reading out or twice normal speed reading out is switched by RM signal outputted from the microcomputer on the AT-115 board. (RM= "H" -Entire pixel reading, RM= "L" -twice normal speed reading out.)

(2) Sync generator

The IC101 (CXD8843R) is programmable SG. The timing of some kinds of pulses outputted from this SG are decided by serial signals (SDATA, SCK, STBSG) with the microcomputer on the AT-115 board. This IC is operated as twice normal speed reading out equivalent. The VD (pin 37 of IC101) is sent to IC104 (SN74HC00), when twice normal speed reading out, as it is, when entire pixel reading out, is masked by 1/2 and is outputted. This signal is sent to TG as VD. The VD of twice normal speed reading out is sent to the AT-115 board and the processor via MB-724 board as communication timing between camera and the processor. The output of pin35 (V WINDOW) and pin 36 (H WINDOW) of IC101 are composed at IC102. The WINDOW pulse is made. This pulse indicates center section of screen. This signal is sent to the AT-115 board via MB-724 board. This signal is used for exposure detection when operating auto white balance and METERING is PEAK setting.

(3) H driver

The output of pin 25 (XH1) of IC5 is sent to IC3 / 7 / 11 (74AC04SJ). The output of pin 26 (XH2) of IC5 is sent to IC2 / 6 / 10. ICs that are signals sent is H driver. These ICs includes 6 inverters. The large current drive can be controlled by three ICs of them are connected in parallel. The one of these ICs are connected to the H1 or H2 of one of CCD imagers. The output of IC2 / 3 is sent to the PA-202 board, The output of IC6 / 7 is sent to the PA-201 board and the output of IC10 / 11 is sent to the PA-200 board.

(4) V driver

The outputs of pin 23 (XV1), pin 22 (XV2), pin 21 (XV3) and pin 18 (XSG) are sent to the IC4 / 8 / 12 (uPD16502GS). The IC4 / 8 / 12 are V driver. This IC generates V1 (value 2) from XV1, V2 (value 3) from XV2 and XSG and V3 (value 3) from XV3 and XSG. The signal of value 2 is -7.5 V / 0 V and the signal of value 3 is -7.5 V / 0 V / 15 V.

The output of IC4 is sent to the PA-202 board, the output of IC8 is sent to the PA-201 board and the output of IC12 is sent to the PA-200 board.

(5) High speed electronic shutter pulse generating

Pin 19 (XSUB) of IC5 outputs the electric charge cleaning pulse for CCD imager. High speed electronic shutter of 1 / 24 seconds or less at twice speed reading out, and 1 / 12 seconds or less at all pixels reading out is realized by setting the output period of cleaning pulse in the 1V. This signal is sent to the IC9 and converted -7.5 V / 15 V pulse (22.5 V at peak to peak). The pin 18 of IC9 is that output. That lower side is clamped at 15 V by C49 and D3. Those signals are added to each V sub via C8, C35 and C59.

(6) V sub generation

Board voltage of CCD imager is decided by each imager. R ch circuit is explained as an example. The setting voltage by RV4 is inputted to the base of Q2. Q2 is differential amplifier. The opposite side of the base becomes the same voltage. The voltage of TP3 is $(R9+R10) / R10$ times of the previous voltage since the base current is minuteness. This voltage is sent to the CCD imager board. As described before, the electronic shutter pulse is also added via C8.

(7) RG clamp

The signals outputted from pin 27 (RG) of IC5 are passed through each clamp capacitor C2, C29 and C53 and lower clamped. They are sent to the CCD imagers.

5. MB-724 board

MB-724 board connects between each circuit boards as mother board.

Other circuits are receiving return video signal from processor and the driver circuit. RET VIDEO (pin 7 of CN209) is main signal. RETV GND (pin 8 of CN209) is GND. The RET VIDEO is sent to the emitter of Q203 via R203, R244 and C220. The RETV GND is sent to the base of Q203 via Q201. The frequency response compensation of connection cable is performed at this process. Q202 through Q207 are the feedback amplifier. The emitter output of Q207 is divided by two. One is inputted to IC201 via Q208 and Q209. The IC201 is 75 Ω driver of video signal. The output of pin 12 of IC201 is inputted to pin 4 of CN207 and is sent to the BNC connector via CN-1395 board as MONITOR output. Another is passed through Q210, Q211 and pin 1 of CN207 and inputted to the pin 8 of DIN connector via CN-1395 board as view finder output. This board composes DC-DC converter that supplies each converted voltages from processor +12 V power to each board.

[6] AT-115 board

AT-115 board is composed following circuits.

- One chip microcomputer
- Microcomputer reset circuit
- EEPROM
- Video signal detection circuit
- Lens control circuit for video camera
- Communication buffer with the processor
- Detection sensor for camera setting direction

(1) One chip microcomputer

IC10 is one chip microcomputer uPD78P218AGC. This microcomputer performs camera block control, communication with the computer of processor side, communication (control) with exclusive lens, control of lens for video camera and reading of remote controller switch mode.

(2) Microcomputer reset circuit

The IC8 (TL7705ACPS) resets microcomputer of IC10 when turning power on.

(3) EEPROM

IC12 (M6M80021) is EEPROM that stores each setting values of D/A converter on PR-228 board and the damage information of CCD imager. The damage information of CCD imager is sent to the processor, and when video data is transmitted, damage correction is performed.

(4) Video signal detection circuit

The Q1 through Q20, IC1 through IC6 and IC14 are video signal detection circuit. This circuit performs detection of white balance and black balance and brightness detection of live picture mode.

(5) Lens control circuit for video camera

IC11 (M62352GP) is D/A converter of 8 bit 12 ch. The microcomputer controls the iris of lens for video camera through this IC. This D/A converter outputs 0 V at 00 (hexadecimal), 5 V at FF(hexadecimal).

The iris value of lens is set by output of pin 18 of IC11. This signal is converted the level by IC7 and outputted to pin 48 of CN1. It is passed through the MB-724 board and CN-1462 board. It is sent to the lens. The servo of lens is switched by the output of pin 19 of IC11. This signal is driven by Q21 and Q22 and is sent to the lens in the same way above. The iris operation of lens is changed at REMOTE or LOCAL by switching output pin 2 of IC11 with two values 5 V / 0 V.

(6) Communication buffer with the processor

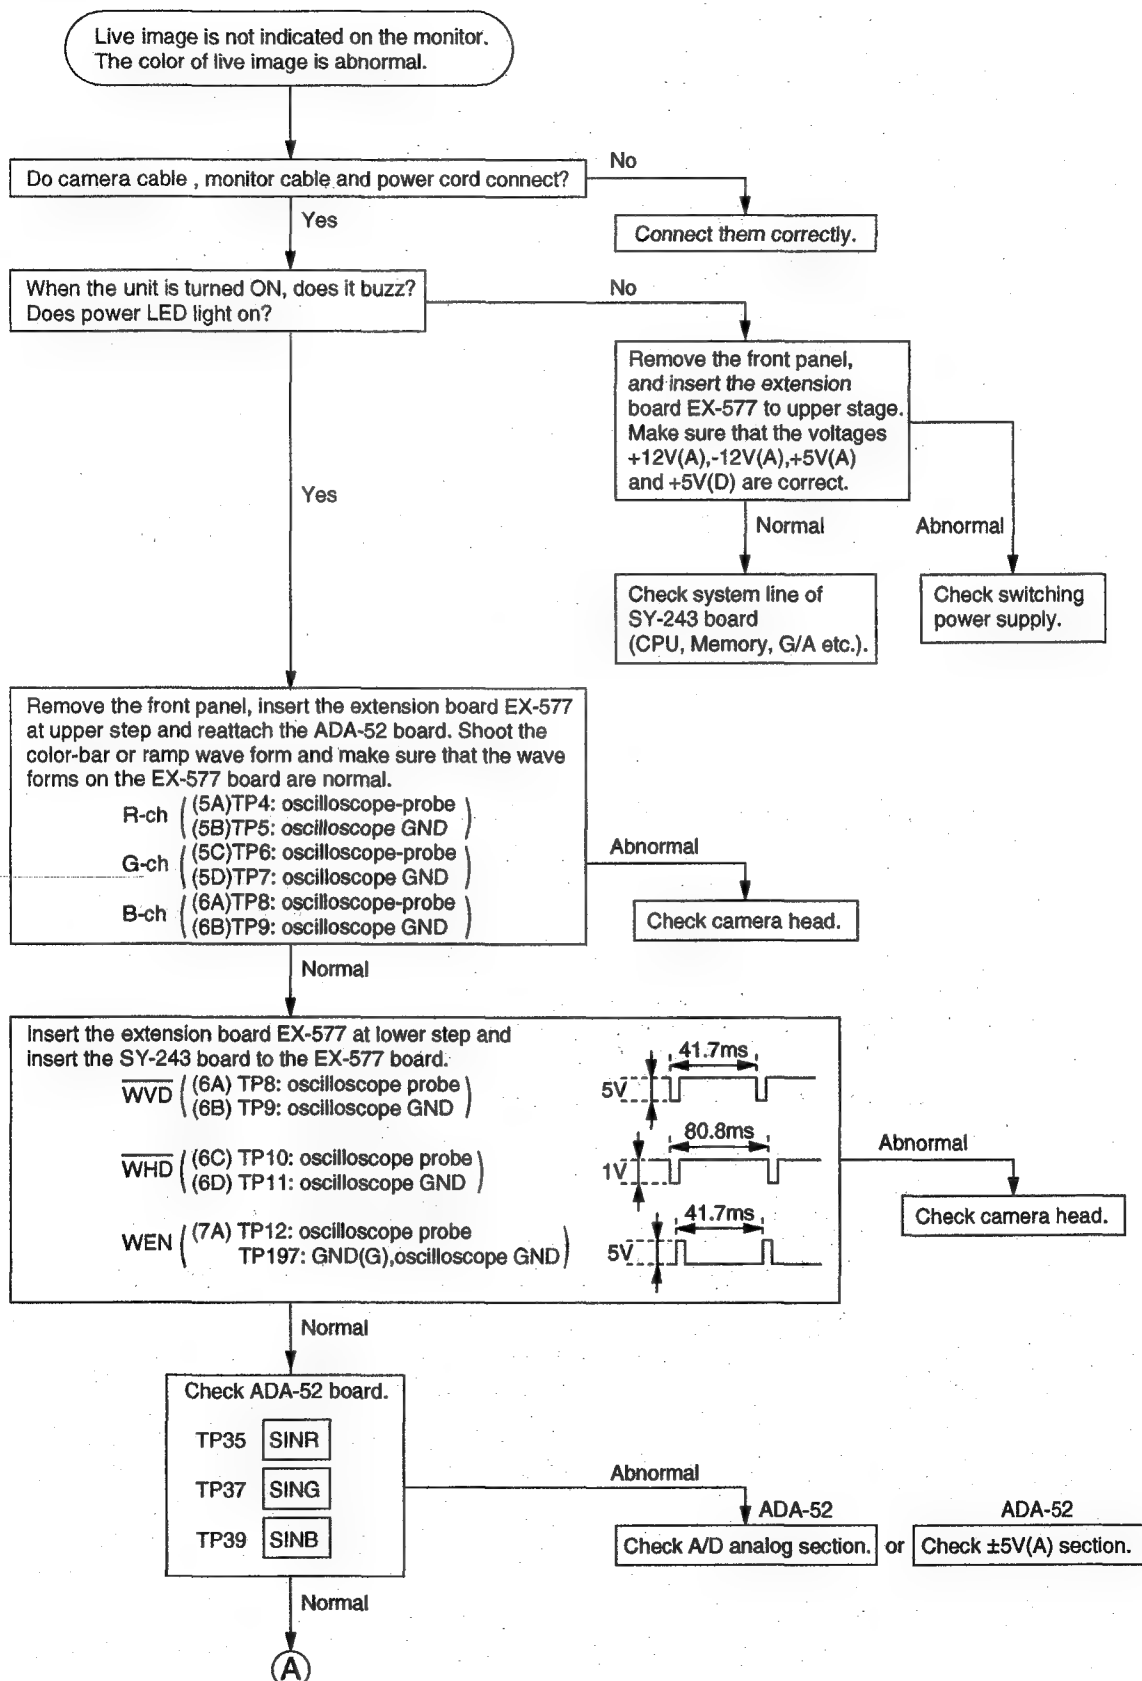

IC13 is the buffer between the processor and communication line. The output of pin 37 (TXD) is sent to the pin 3 of IC10, and converted the differential digital signal. It is outputted to pin 5 (TXD+) and pin 6 (TXD-) and sent to the processor via MB-724 board. Conversely, the differential digital signal at pin 8 (RXD+) and pin 7 (RXD-) of IC13 is converted to the digital signal 5 V / 0 V. It is sent from pin 2 of IC13 to pin 36 (RXD) of IC10.

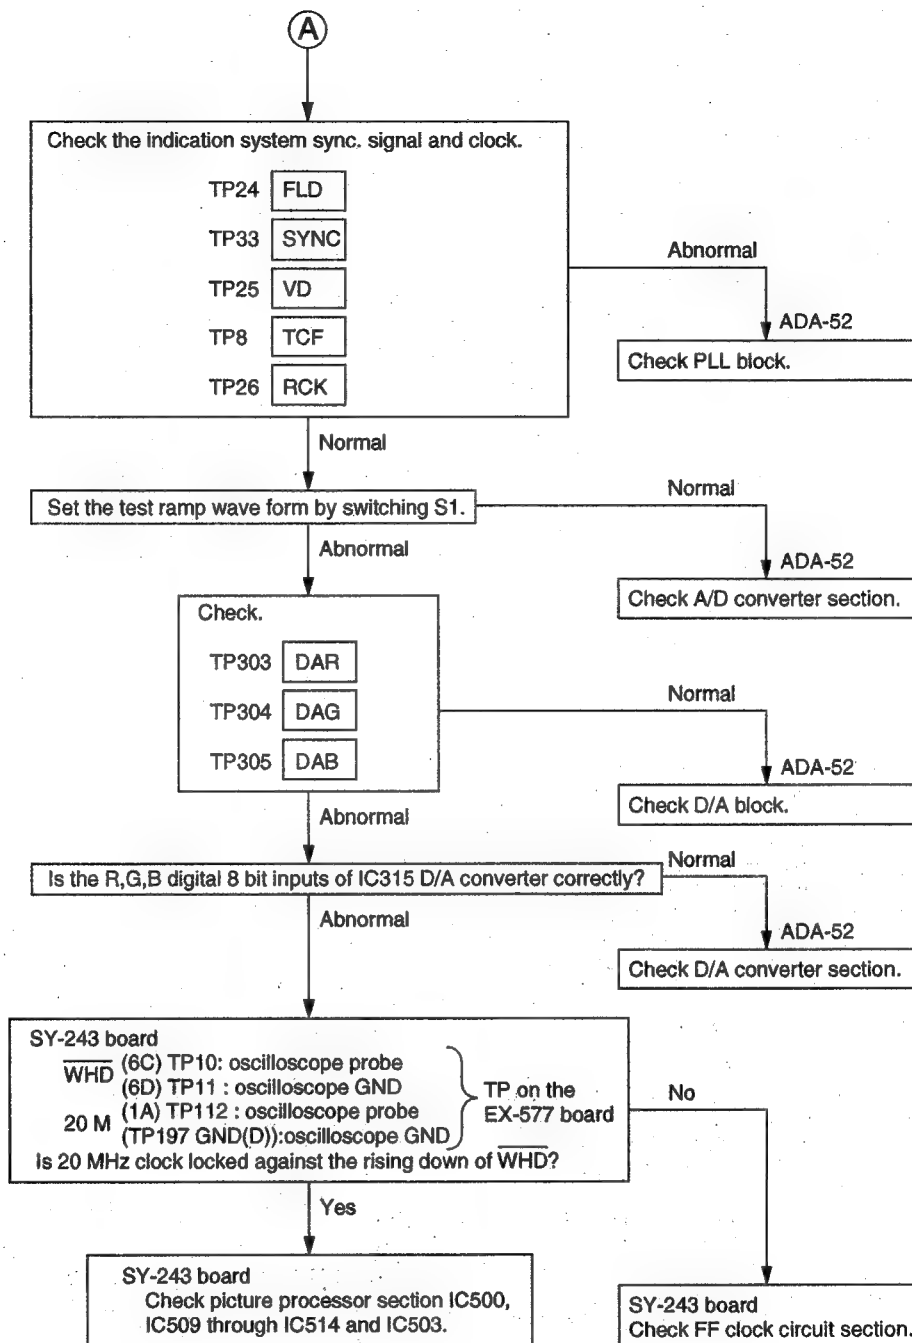

(7) Detection sensor for camera setting direction

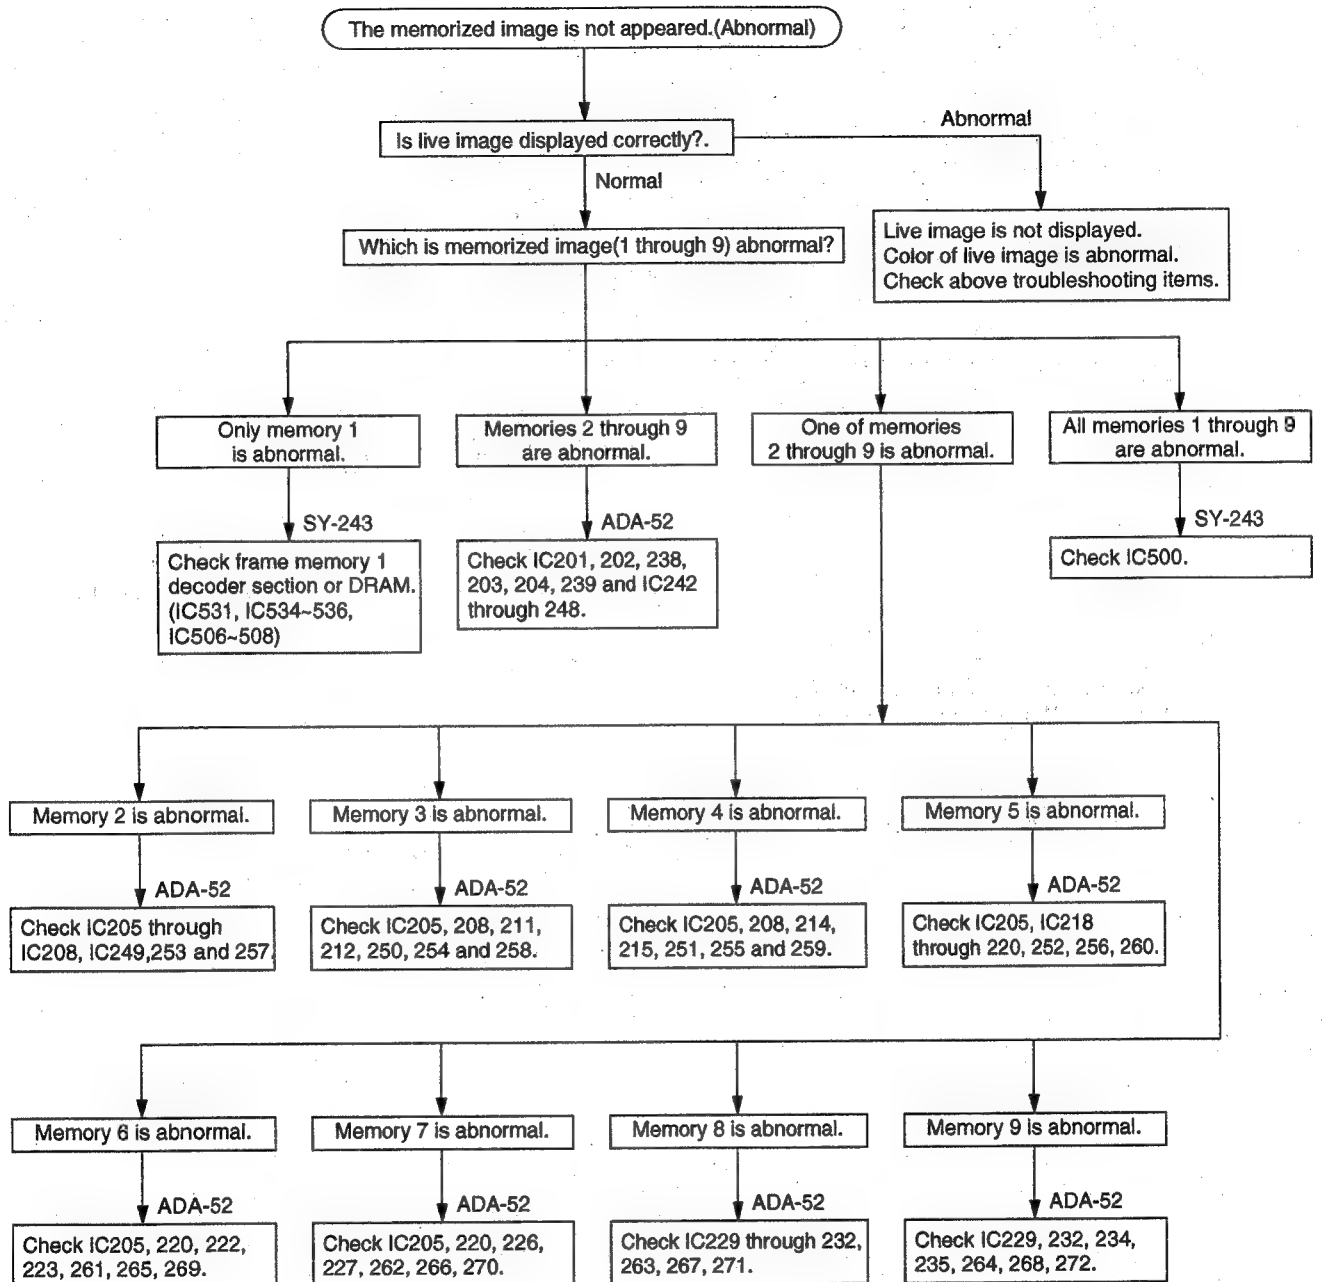

The SE1 (RIP-1020) detects setting direction of camera by slanting sensor. The pin 3 of SE1 is output. When regular setting, output is "L", when vertical setting, output is "H". This output is inputted to the computer pin 33 (TILT) of IC10. Its information is sent to the computer of the processor and decided the direction of character indicating on the picture screen.

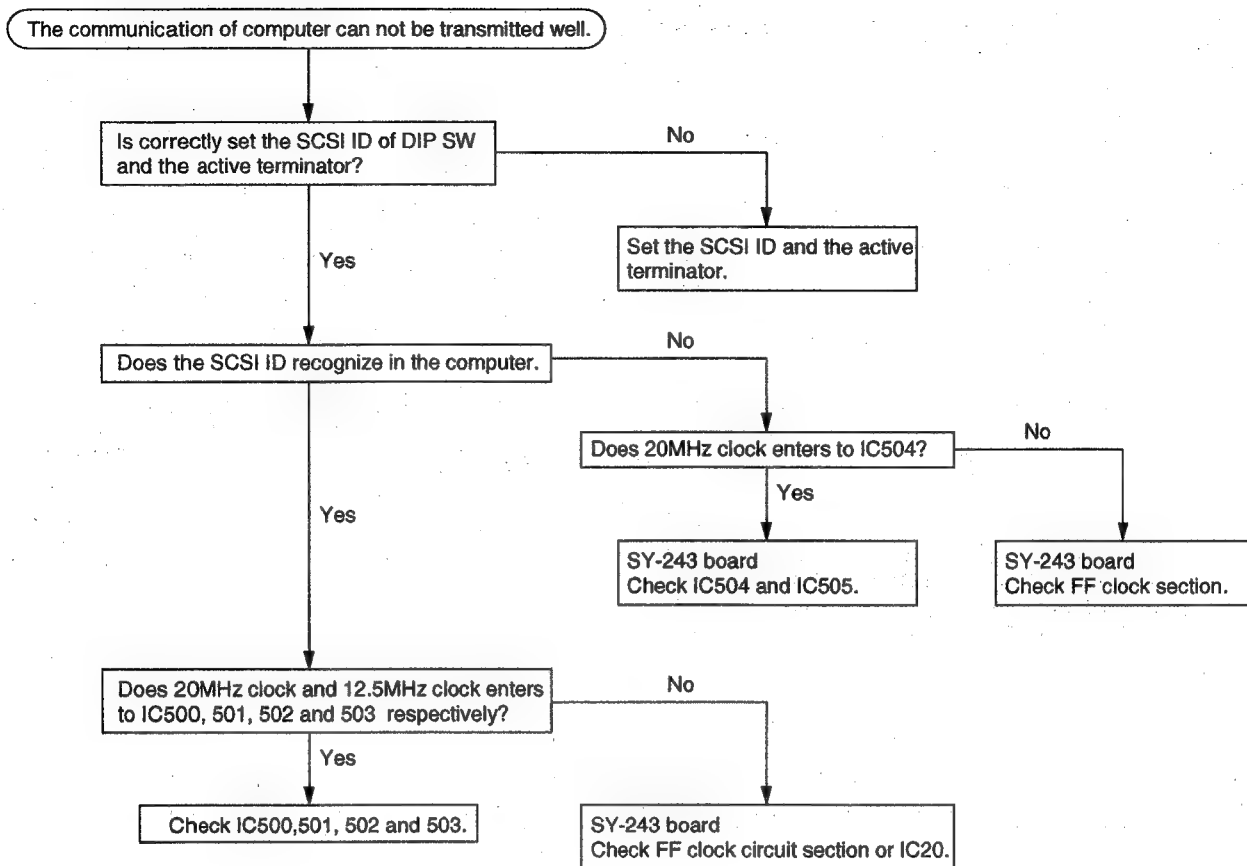

SECTION 5 TROUBLE SHOOTING

5-1. PROCESSOR BLOCK

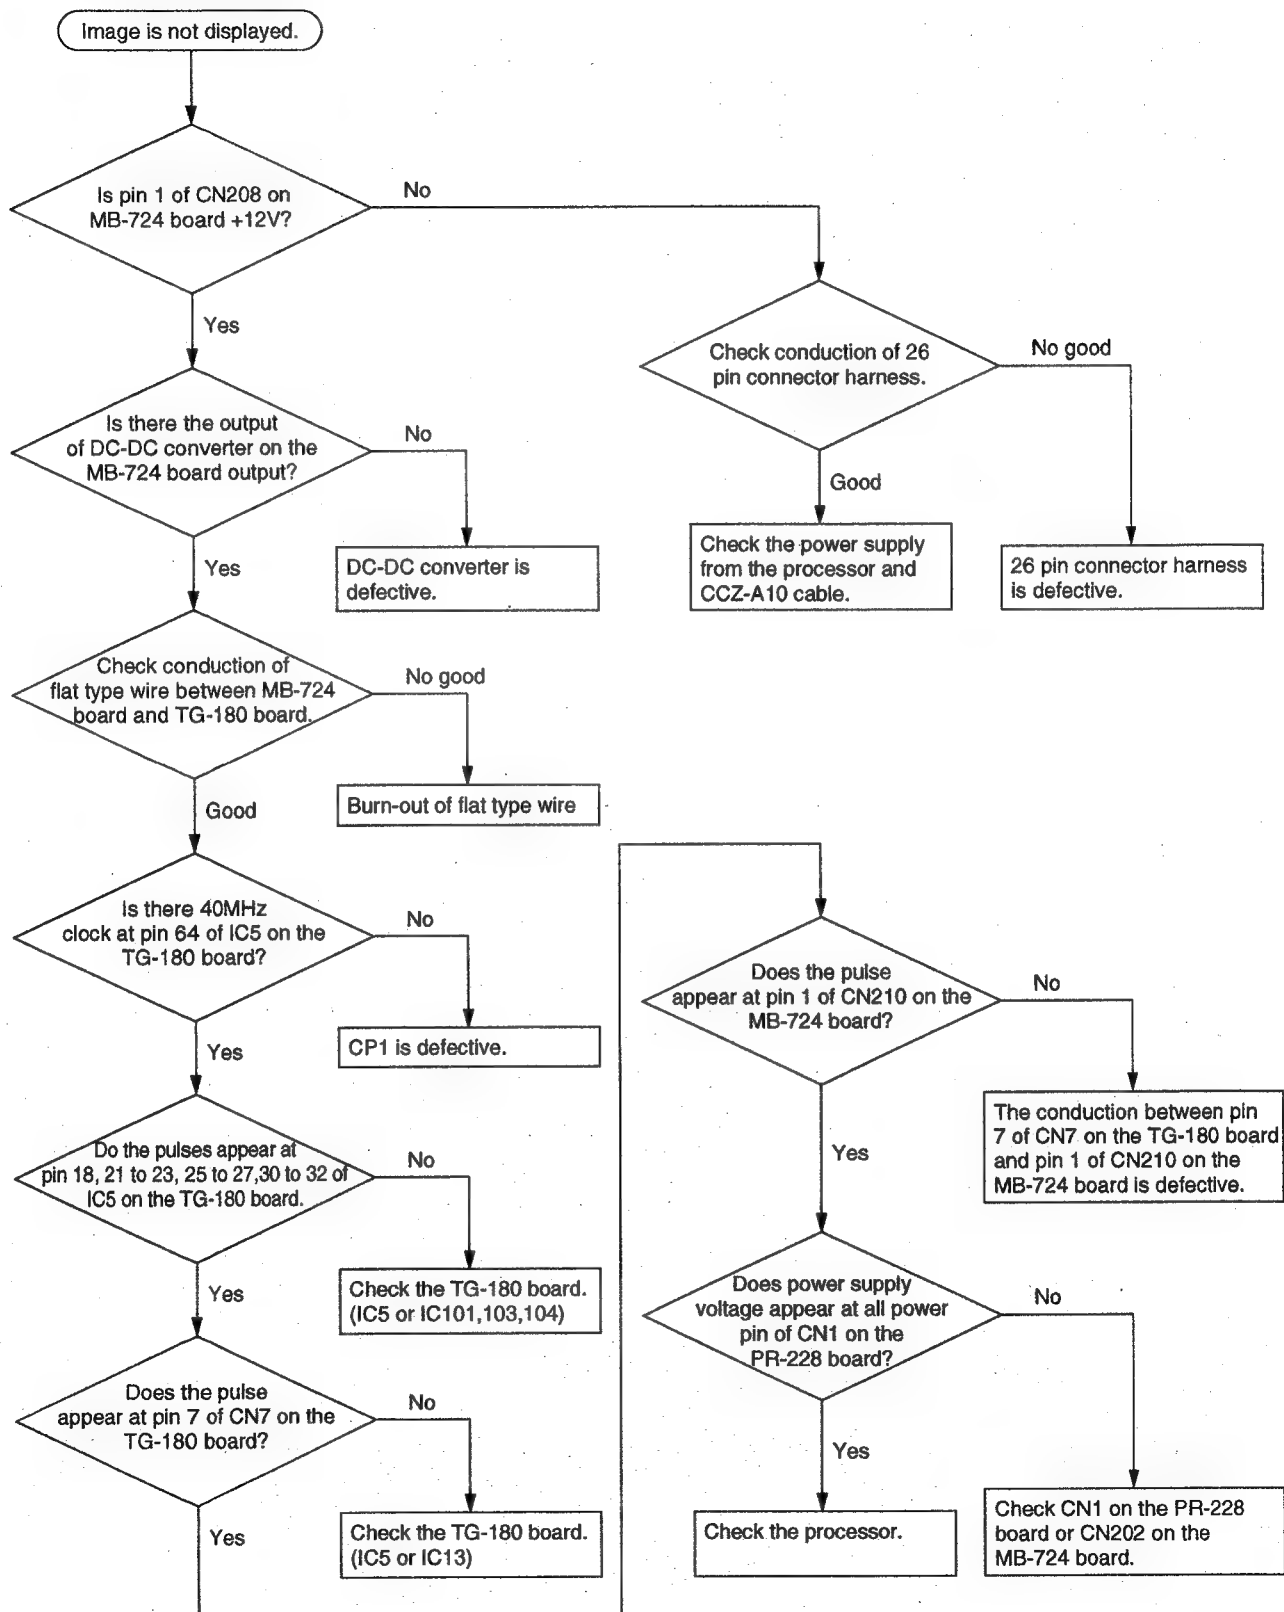

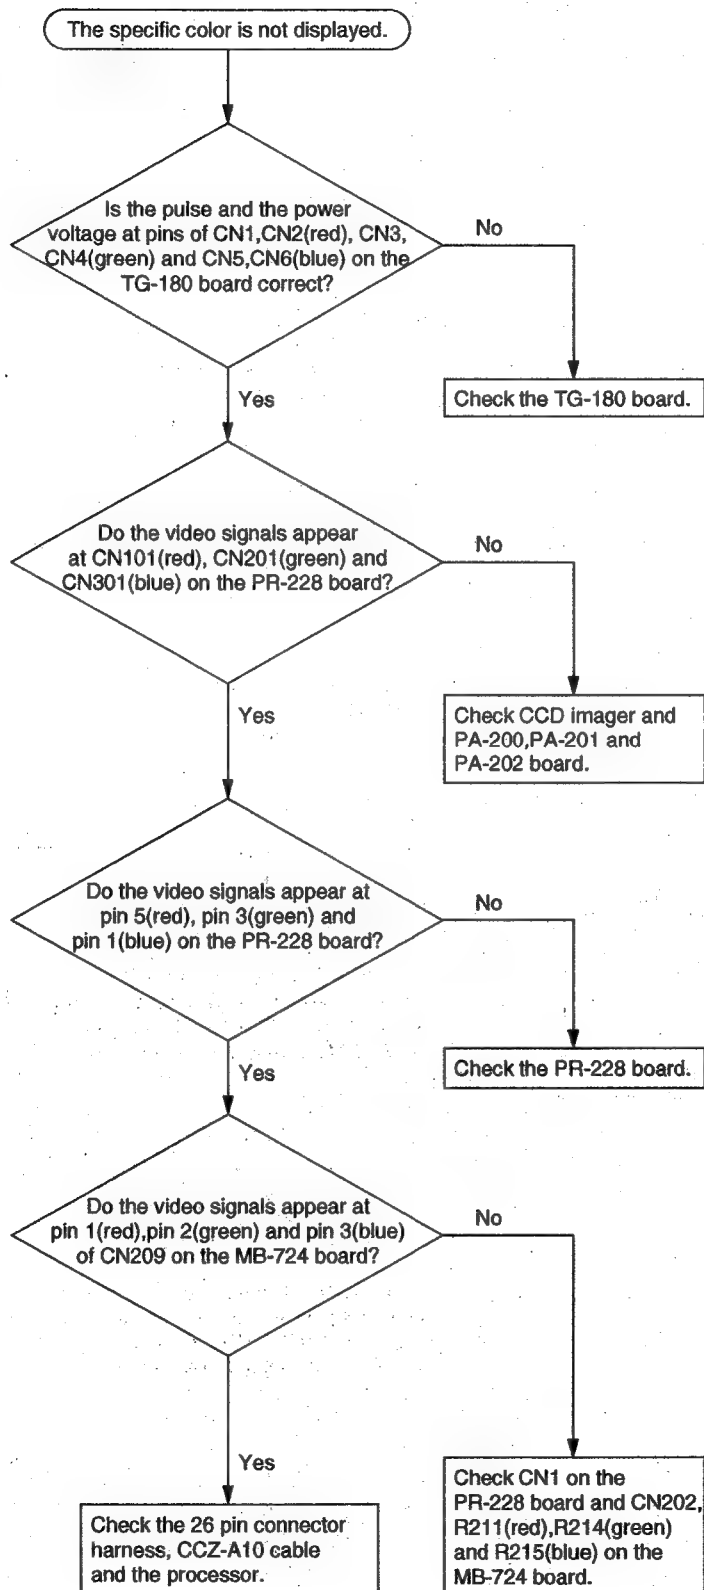

5-2. CAMERA BLOCK

- (1) Picture is not indicated.
- (2) The specific color is not indicated.
- (3) The remote control can not be worked.
- (4) Zoom and focus of special lens can not be worked.
- (5) Flashlight does not flash.
- (6) White balance and black balance can not be adjusted.

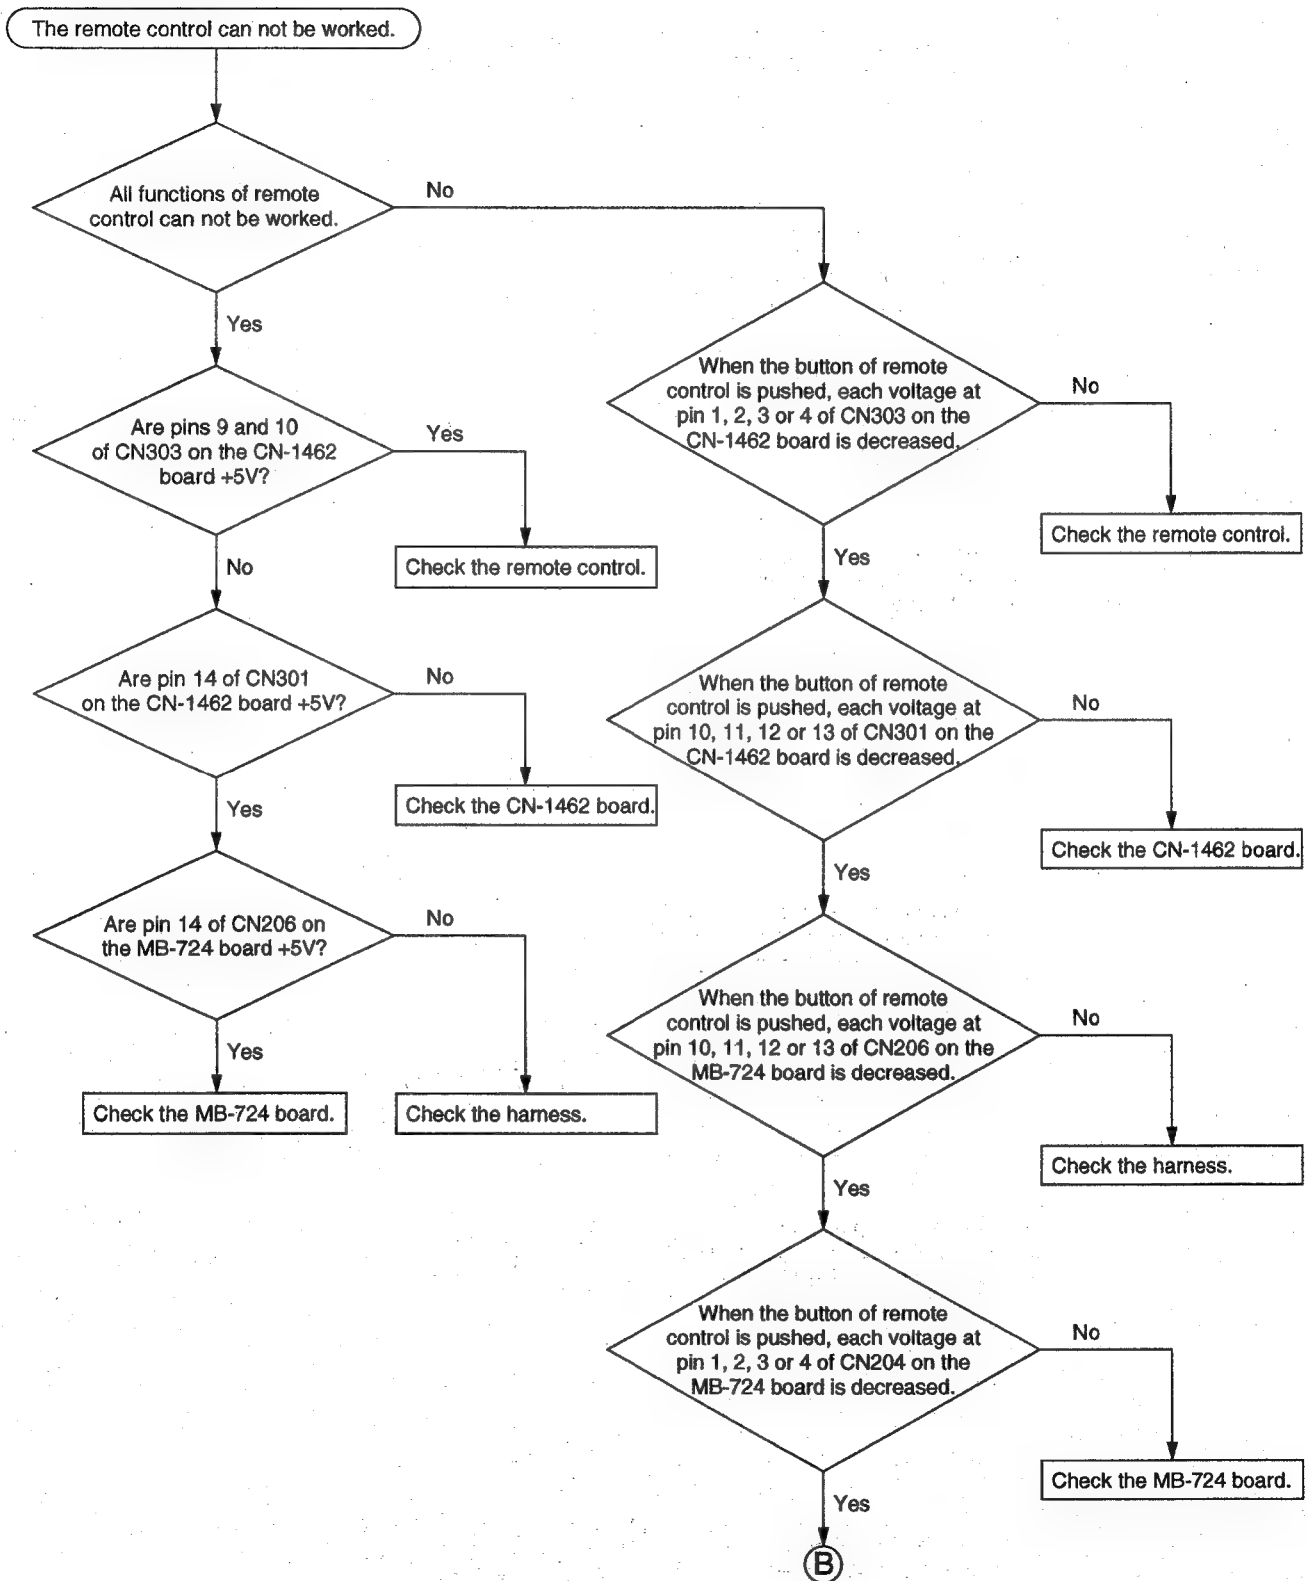

(1) Image is not displayed.

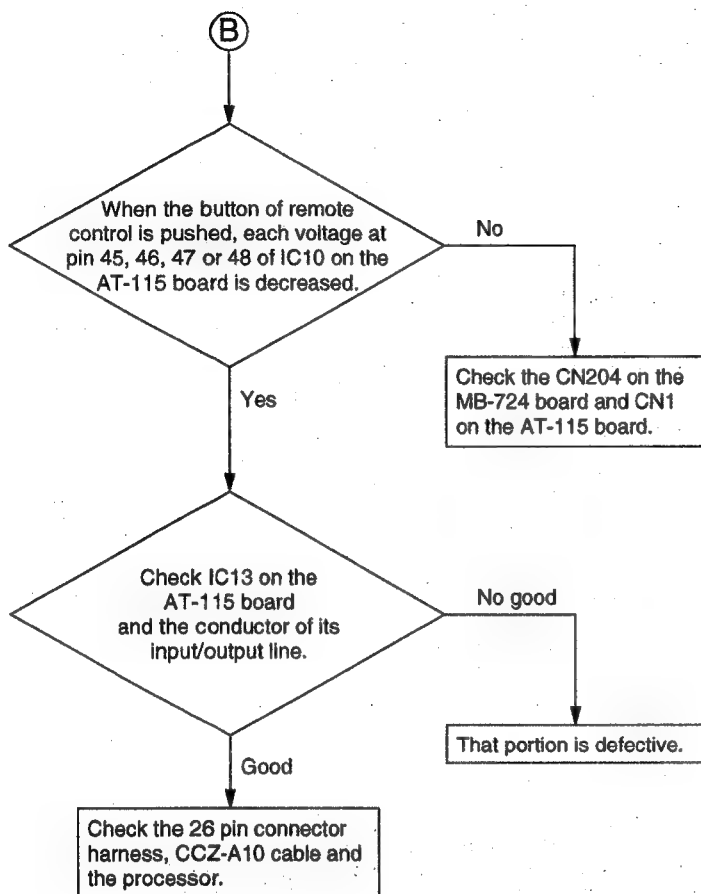

(2) The specific color(red, green, blue) is not displayed.

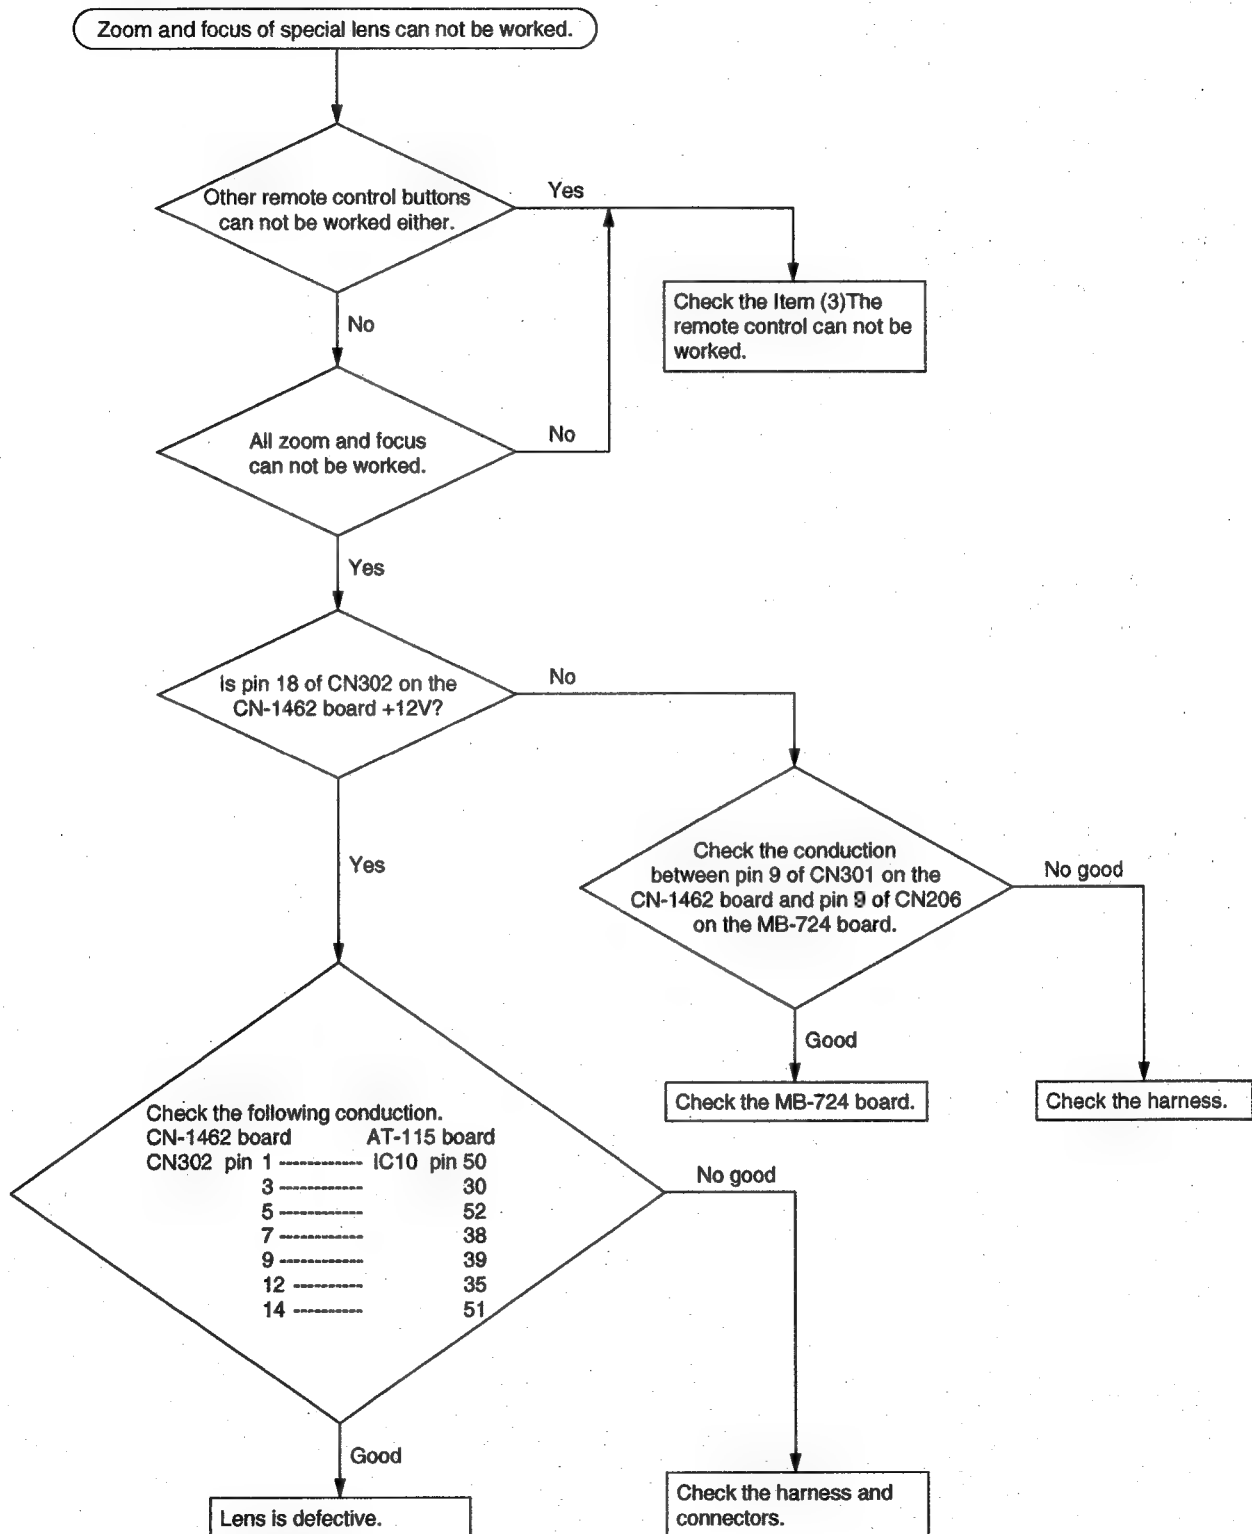

(3) The remote control can not be worked.

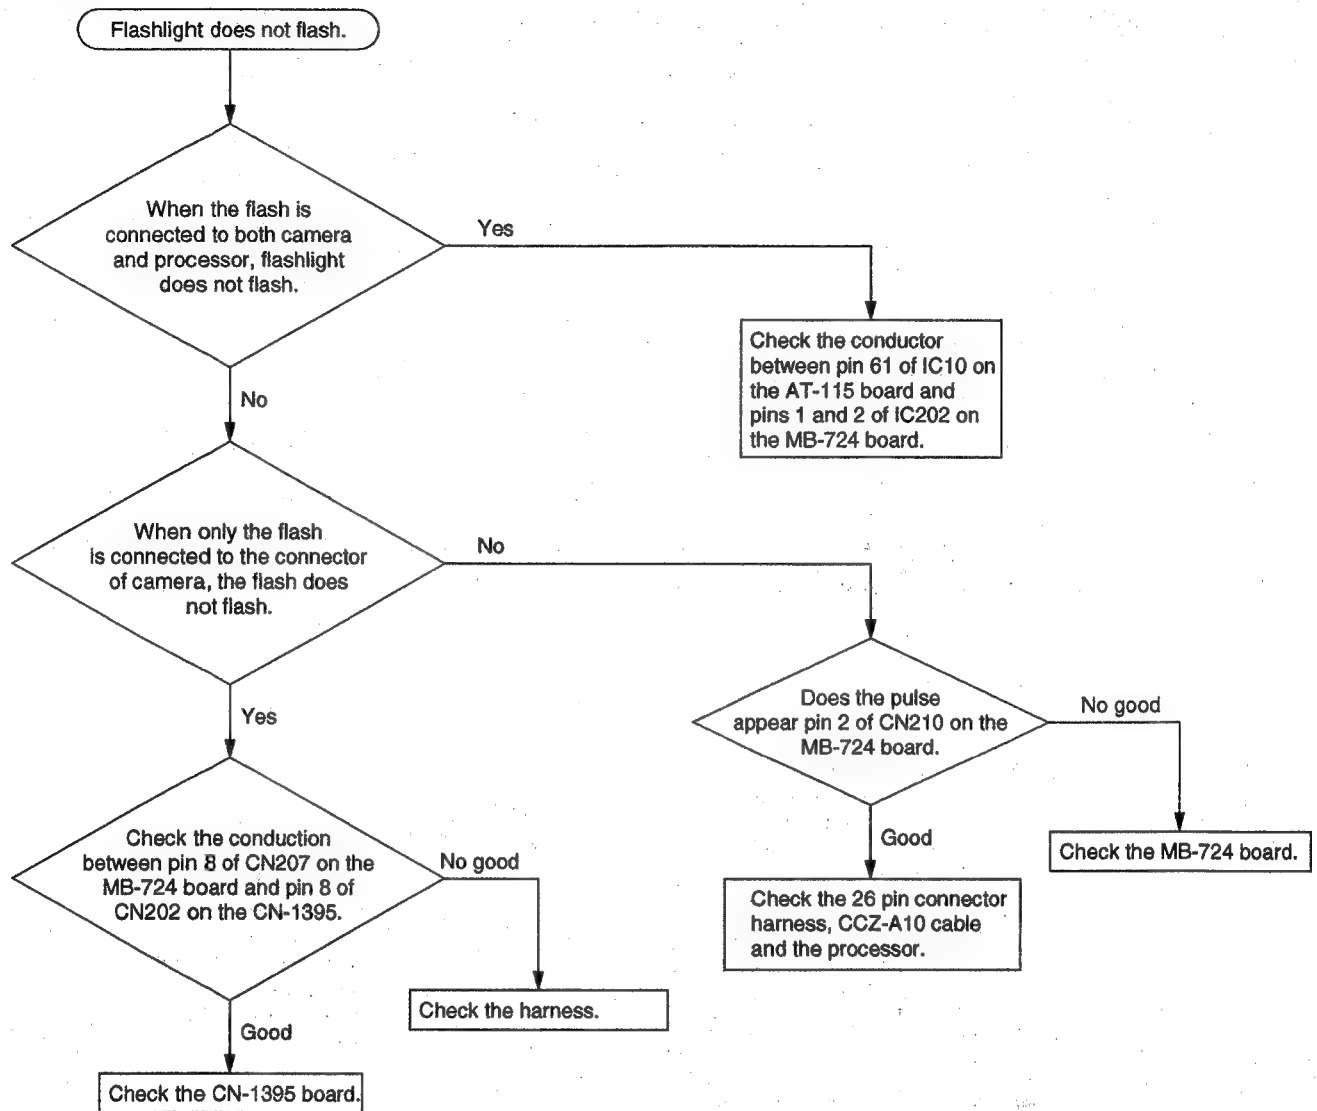

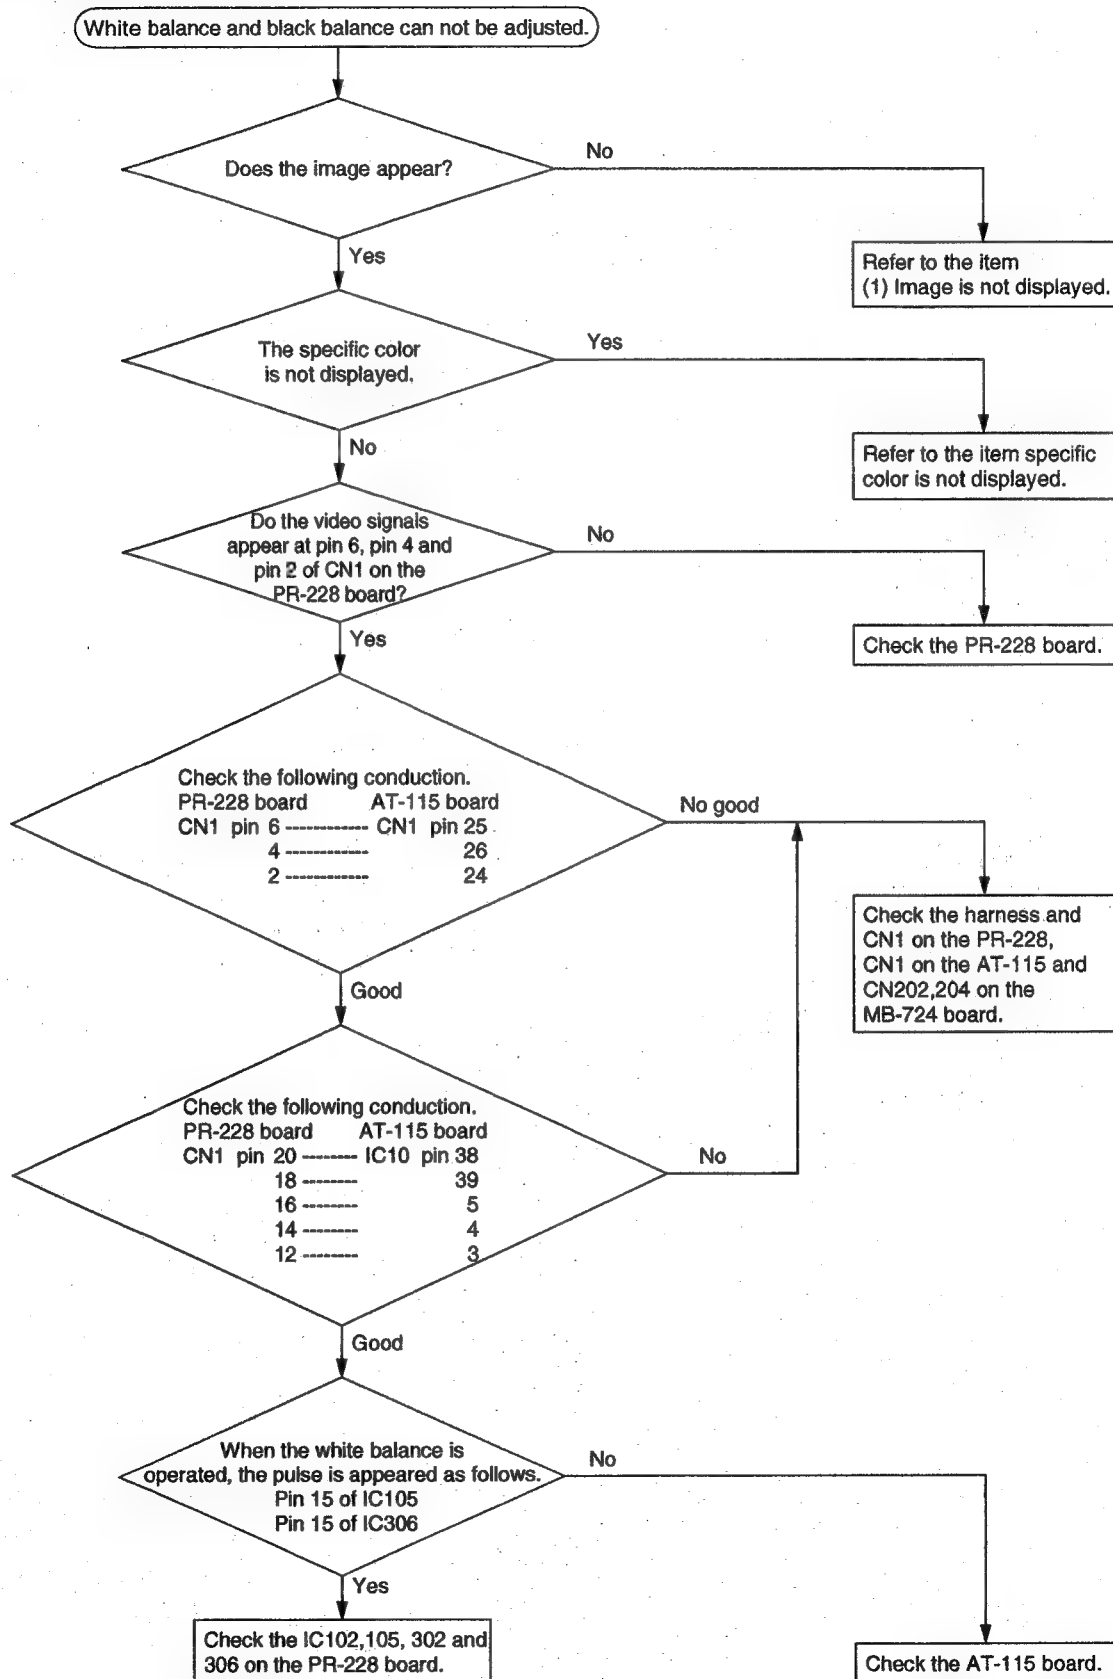

(4) Zoom and focus of special lens can not be worked.

(5) Flashlight does not flash.

(6) White balance and black balance can not be adjusted.

SECTION 6

SEMICONDUCTOR PIN ASSIGNMENTS

Semiconductors of which functions are equivalent are described here. For parts replacement, refer to the section of Spare Parts in this manual. The circuit diagram of each IC is obtained from the IC data book published by the manufacturer.

INPUT
 ADCK : S/H TRIGGER PULSE INPUT FOR A/D
 ADJ : INTERNAL S/H SAMPLING WIDTH ADJUSTMENT
 AGCCONT : AGC AMPLIFIER GAIN ADJUSTMENT
 AGCMAX : AGC AMPLIFIER MAX GAIN ADJUSTMENT
 CAMIN : AGC OUT (PIN-28) COUPLING DEPENDING ON CAPACITY
 CAVI : CAMERA MODE (EMPHIN/CAMIN → OUT) AND
 VTR MODE (VTRIN → OUT) SWITCHING AT INPUT STAGE
 CLP1 : CLAMP PULSE CLP1 : CAMERA
 CLP4 : CLAMP PULSE
 CSCLP : CAPACITOR CONNECTION FOR CLAMPING
 CSSL : THRESHOLD ADJUSTMENT FOR CHROMA SUPPRESSION
 DATAIN : CCD SIGNAL INPUT
 EMPHIN : HAS AGC OUT (PIN-28) OUTPUT SIGNAL PASSED THROUGH
 EXTERNAL BAND PASS FILTER (CHROMA COMPONENT ONLY)
 PGIN : CCD SIGNAL INPUT
 STBY : A1399 POWER SAVE MODE SWITCHING (NORMALLY GND)
 VCLP : CLAMP PULSE VCLP : VIDEO
 VRBS : INTERNAL OPERATION AMPLIFIER INVERTED INPUT IN 2V REGULATOR
 VRTS : INTERNAL OPERATION AMPLIFIER INVERTED INPUT IN 4V REGULATOR
 VTRIN : VIDEO PLAYBACK SIGNAL
 XSHD : HIGH SPEED PULSE INPUT FOR S/H
 XSHP : HIGH SPEED PULSE INPUT FOR S/H

OUTPUT
 AGCOUT : AGC OUTPUT
 CSOUT : FOR CHROMA SUPPRESSION AND FOR SELECTING
 S/H CIRCUIT OPERATION FOR A/D
 OUT : DRIVER OUTPUT STANDARD D RANGE : 2.2V
 OUTCLP : CLAMPS BLACK LEVEL OF OUT (PIN-8)
 OUTPUT SIGNAL AT 2.0V
 VRBO : 2V REGULATOR
 VRTO : 4V REGULATOR

SECTION 7 SPARE PARTS

7-1. NOTES ON REPAIR PARTS

(1) Safety Related Components Warning

Components marked \triangle are critical to safe operation. Therefore, specified parts should be used in the case of replacement.

(2) Standardization of Parts

Repair parts supplied from Sony Parts Center may not be always identical with the parts which actually in use due to "accommodating the improved parts and/or engineering changes" or "standardization of genuine parts".

This manual's exploded views and electrical spare parts list are indicating the part numbers of "the standardized genuine parts at present".

(3) Stock of Parts

Parts marked with "o" SP (Supply Code) column of the spare parts list are not normally required for routine service work. Orders for parts marked with "o" will be processed, but allow for additional delivery time.

(4) Units for Capacitors, Inductors and Resistors

The following units are assumed in schematic diagrams, electrical parts list and exploded views unless otherwise specified.

Capacitors : μF
Inductors : μH
Resistors : Ω

SECTION 9
PRINTED WIRING BOARDS AND SCHEMATIC DIAGRAMS

THIS NOTE IS COMMON FOR PRINTED WIRING
BOARDS AND SCHEMATIC DIAGRAMS.
(In addition to this, the necessary note is printed
in each block.)

- **For Schematic Diagrams.**
- Caution when replacing chip parts.
New parts must be attached after removal of chip.
Be careful not to heat the minus side of tantalum
capacitor, because it is damaged by the heat.
- All resistors are in ohms, 1/10W unless otherwise noted.
k: 1000 , M : 1000k .
- All capacitors are in μ F unless otherwise noted.
pF: μ F.
- 50V or less are not indicated except for electrolytics and
tantalums.
- All variable and adjustable resistors have characteristic
curve B, unless otherwise noted.
-  : nonflammable resistor.
-  : fusible resistor.

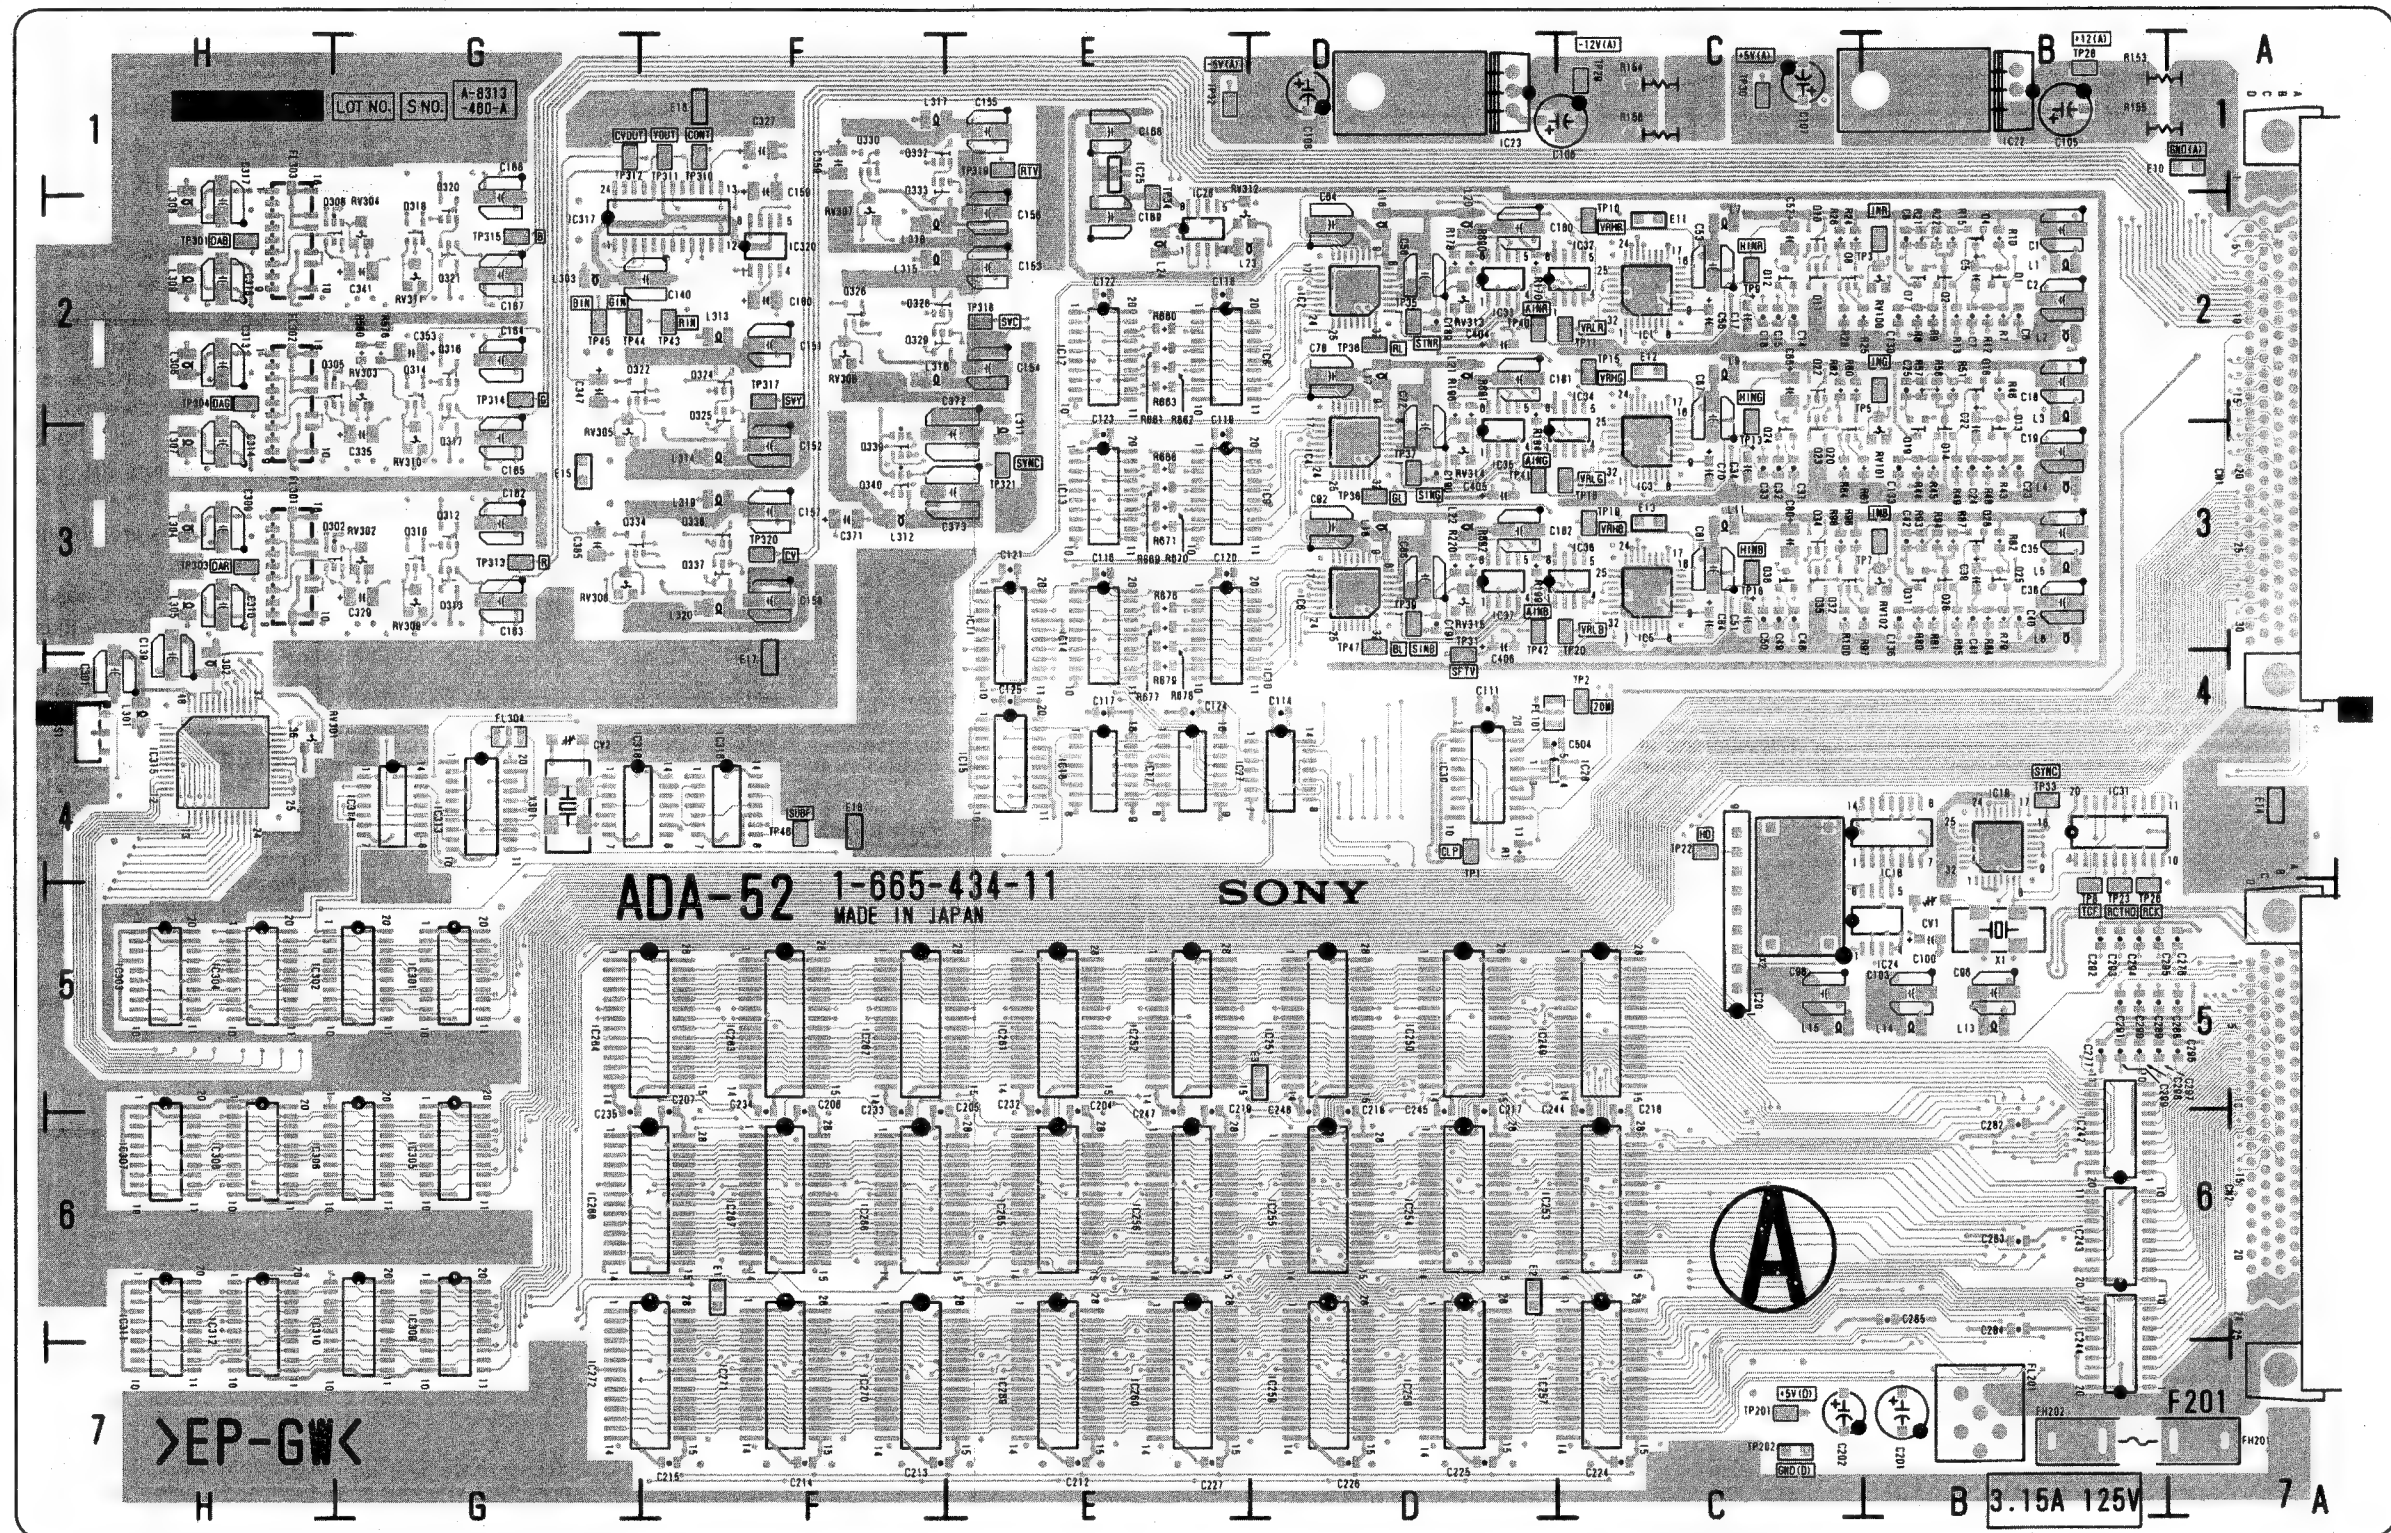

Note: The components identified by mark  are
critical for safety. Replace only with part
number specified.

Note: Les composants identifiés par une marque 
sont d'une importance critique pour la sécurité.
Ne les remplacer que par des pièces de numéro
spécifié.
